ABSTRACT

During my 15 days internship at AK Infopark Private Limited. I embarked on a focused journey in UI/UX Design, gaining valuable hands-on experience and insights into various aspects of app designing.

User interface (UI) and user experience (UX) design plays a pivotal role in shaping how individuals interact with technology. This abstract explores the transformative potential of UI/UX design through the lens of an internship experience.

The internship aims to delve into the foundational principles of UI/UX design, emphasizing iterative prototyping, user research methodologies, and the art of crafting intuitive user interfaces. By immersing oneself in this dynamic field, the intern will engage in hands-on projects aimed at solving real-world design challenges.

Key learning objectives include mastering industry-standard design tools, understanding the importance of usability testing in refining design solutions, and fostering a deep appreciation for the symbiotic relationship between aesthetics and functionality in digital products.

8	Component	40-43
9	Prototype	44-55

1. Introduction

UI Designer

A UI (User Interface) designer is responsible for creating visually appealing and user-friendly digital products, such as websites, mobile apps, and software.

Their goal is to design interfaces that are easy to use, and provide a seamless user experience.

Key Skills

- Proficiency in design tools like Figma, Adobe XD, Photoshop.
- Strong understanding of design principles, and user experience (UX).
- Excellent communication and collaboration skills.

UX (User Experience)

UX (User Experience) design is the process of creating products, systems, and services that are easy to use, and provide a seamless experience from users.

Key aspects of UX

- **User research:** Understanding user needs, behaviours, and motivations.
- **User journey mapping:** Visualizing the user's experience across multiple touch points.

- **Wireframing and prototyping:** Creating low-fidelity sketches and interactive prototypes.
- **Usability testing and feedback:** Validating design decision with real users.
- **Interacting design:** Crafting the interactions and behaviours of digital products.
- **Visual design:** Creating the visual aesthetic and design language.

2. Computer analysis

Competitor analysis is a crucial step in the UI/UX design process. It involves researching and analysing the design elements, user experience, and features of competitor products or services to identify strengths, weakness, and opportunities for differentiation.

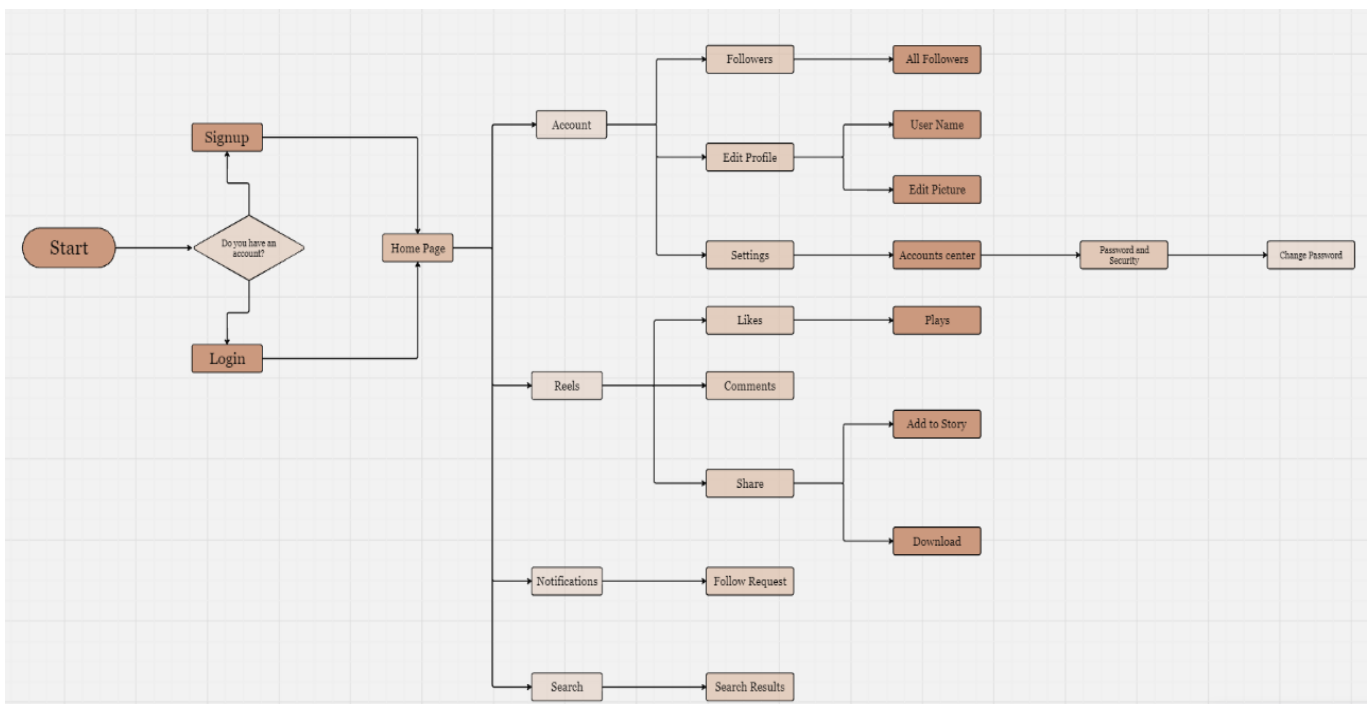

Diagram

	Position	Key Features	Audience	Strength	Weakness	Opportunities	Threats	Cost	Reviews
INSTAGRAM	Direct	1.Editing 2.Direct Messaging 3.Tagging 4.Hashtag	Students and working people	1.Download option 2.Editing 3.Collaborations 4.Live streaming	1.Limited 2.Discoverability 3.Length of the reels are short 5.Lots of bug	Ability to reach large audience	1.Phishing 2.Privacy issues 3.Spreading 4.Misinformation	1.Financial cost 2.Reputational or Social cost	Great platform to connect with friends and families
FACEBOOK	Direct	1.React option 2.Tagging	Students and working people	1.Messaging 2.Collaborations 3.Live streaming	1.Lack of users 2.Negative feedback	Ability to reach large audience	1.Phishing 2.Privacy issues 3.Spreading 4.Misinformation	1.Financial cost 2.Reputational cost 3.Acquisition	Great platform to connect with friends and families

3. User Flow

User Flow are an important aspect of UX design. It helps UX designers to see the big picture and understand how much users navigate a website or app. User Flows are typically shown using diagrams, wire flames, prototype, flowcharts, and other tools

User Flow Diagram

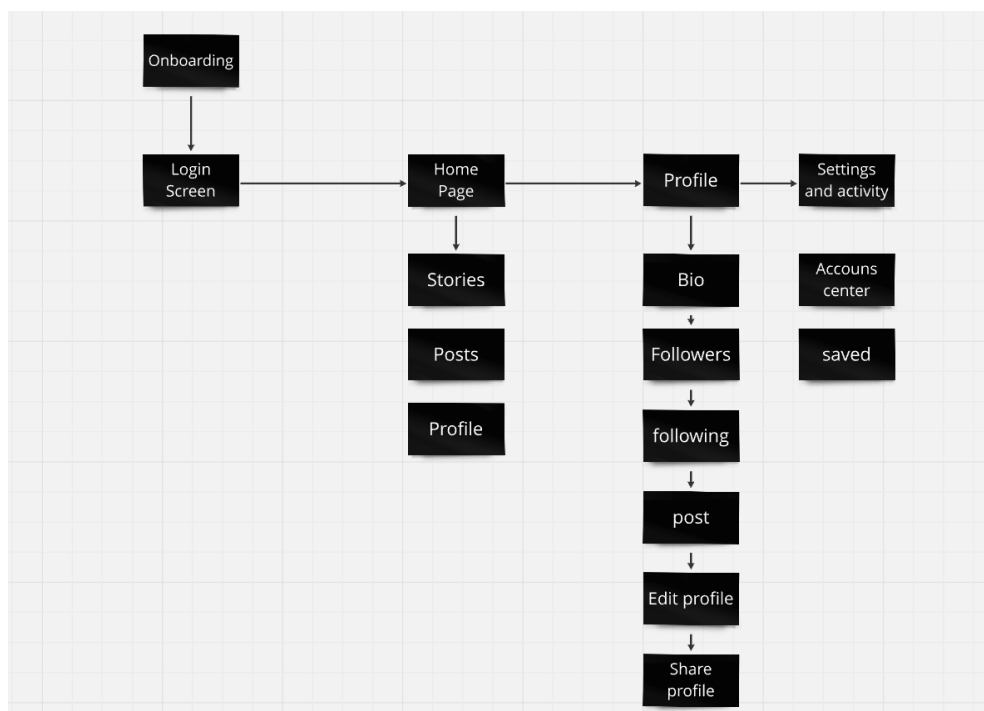

4. Information Architecture

Information architecture is a crucial aspect of UI/UX design, focusing on organizing and structuring content to make it easily accessible and usable.

It involves

- Content categorization and grouping
- Labelling and naming conventions
- Navigation and menu systems
- Search functionality and filtering
- User flow and journey mapping

Information Architecture diagram

5. What now?

Our Response

What do we need to validate

- Audience engagement and research
- Tren and Market analysis
- Influencer collaboration impact
- User Experience

What don't we know

- Algorithm transparency
- Impact on societal trend
- Future platform developments
- Impact of regularity changes

How does it change your process

- Continuous learning and application
- Data analysis and insights

Actions, Motivations, and Pains

Personality

- Calm
- Introvert
- Responsibility

Gardening

- Gardening
- Sports
- Drawing

Values

Goals

- Social connection
- Visual story telling

Challenges

- Privacy concerns
- Fake news

Context

Pain point

- Ad overloaded
- Algorithm frustration
- Cyber bullying and harassment
- Inauthentic engagement

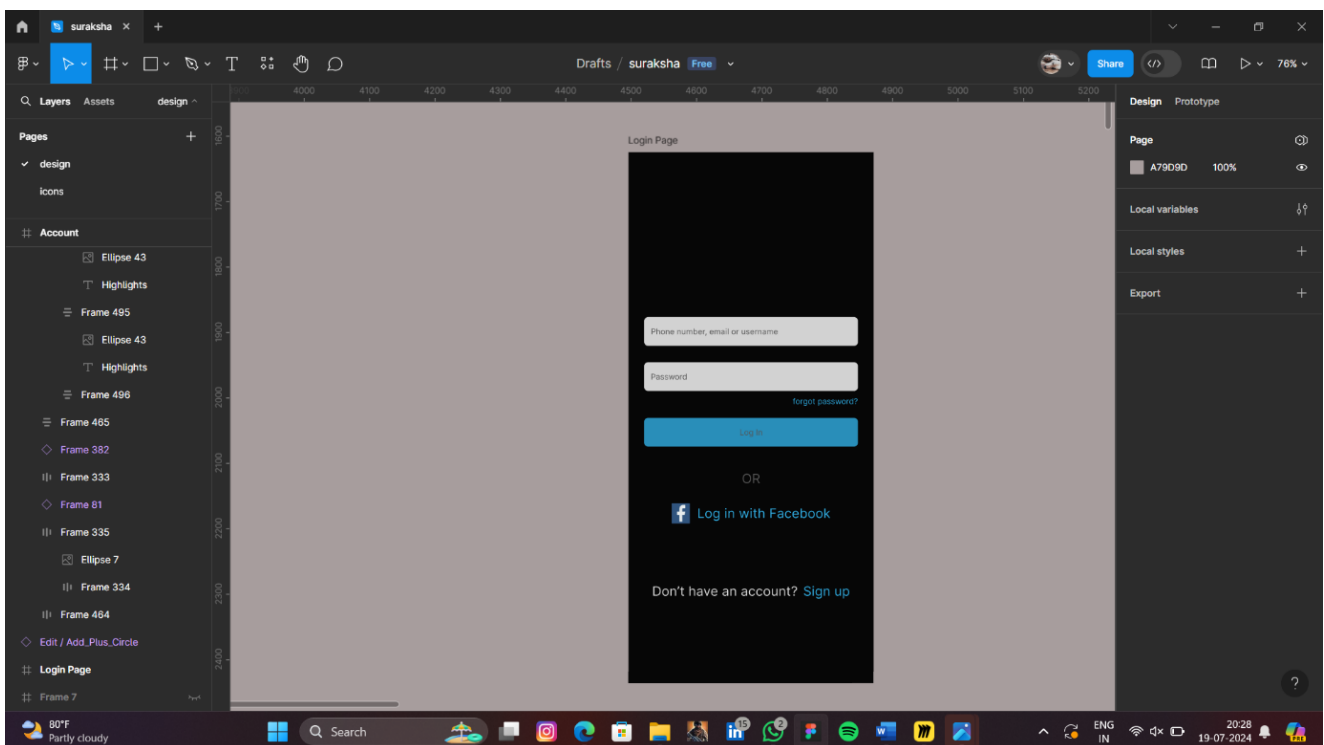

Motivation

- Personal branding
- Entertainment and discovery

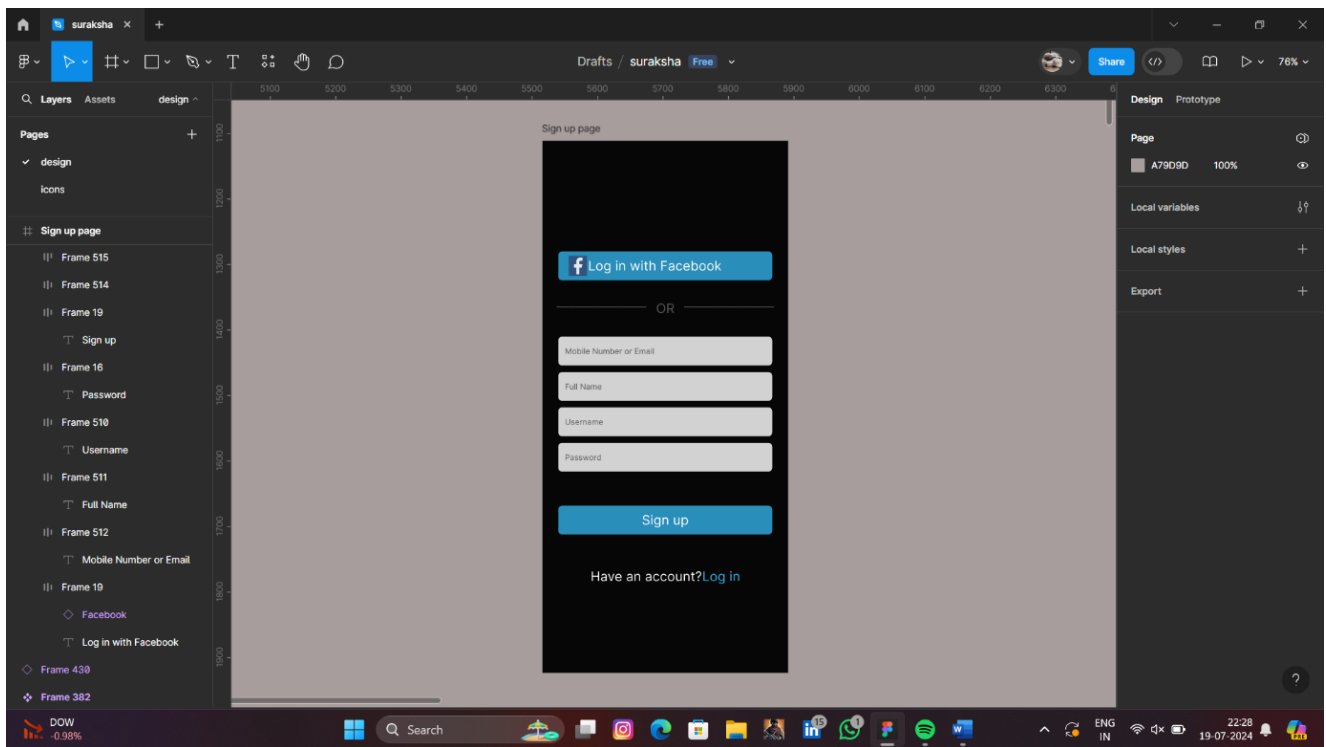

6. Login Page Creation

As a UI/UX designer, creating a login page involves a combination of usability, accessibility, and visual design principle.

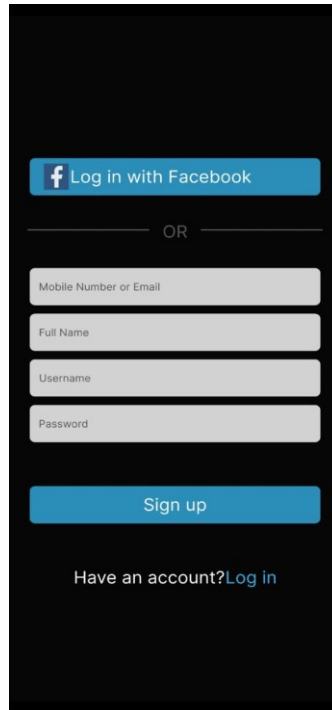

Login Page

Sign Up Page

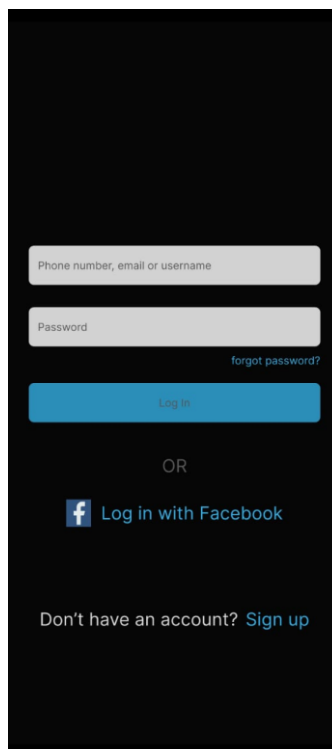

Sign up screen

A mobile app sign-up screen with a dark background. At the top, there is a blue button with a white Facebook 'f' icon and the text 'Log in with Facebook'. Below this is a horizontal line with the word 'OR' in the center. Underneath the line are four light gray input fields stacked vertically, labeled 'Mobile Number or Email', 'Full Name', 'Username', and 'Password'. Below the input fields is a blue button with the text 'Sign up'. At the bottom, there is a link that says 'Have an account? Log in'.

Login screen

A mobile app login screen with a dark background. It features two light gray input fields stacked vertically, labeled 'Phone number, email or username' and 'Password'. To the right of the password field is a link that says 'forgot password?'. Below the input fields is a blue button with the text 'Log in'. Underneath the button is a horizontal line with the word 'OR' in the center. Below the line is a blue button with a white Facebook 'f' icon and the text 'Log in with Facebook'. At the bottom, there is a link that says 'Don't have an account? Sign up'.

7. App Design

App design involves creating a visually appealing and user-friendly interface for mobile applications.

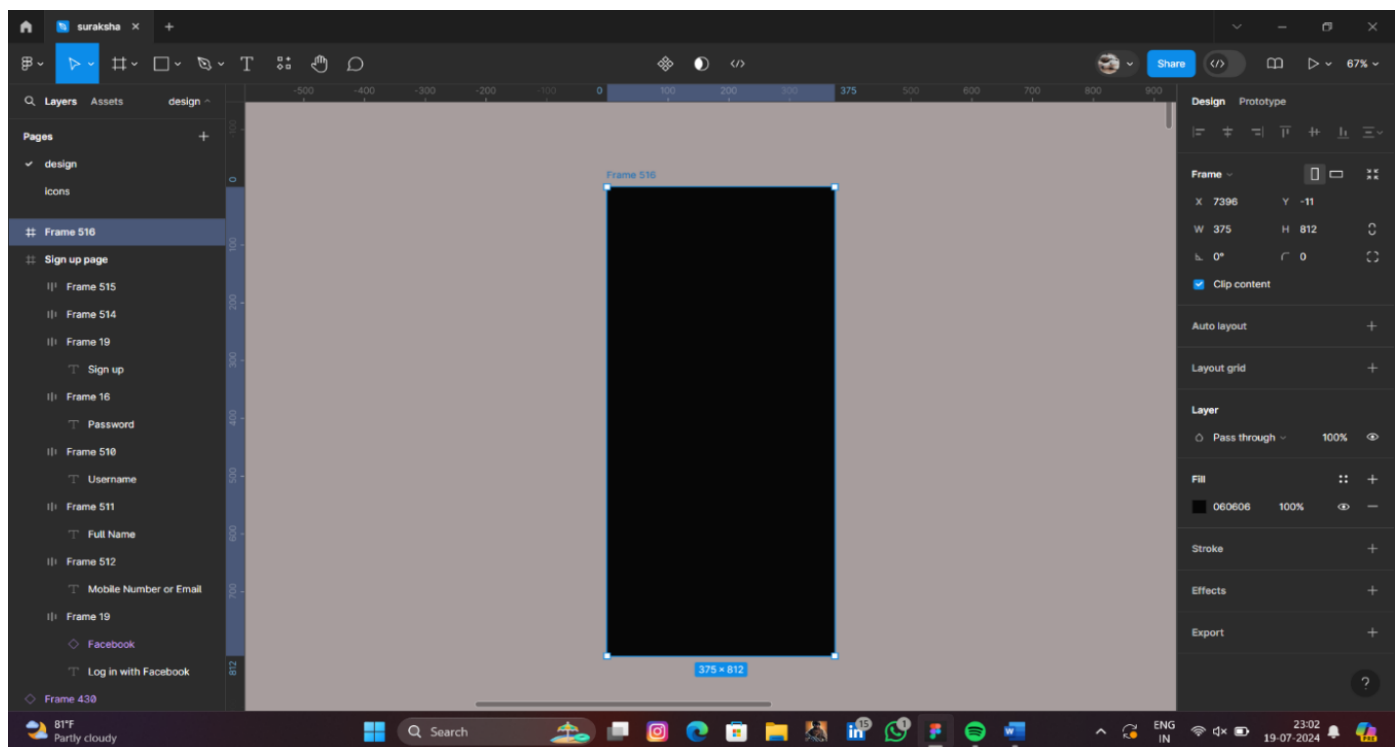

Sign up and create a team

[Sign up for a free Figma account](https://figma.com) at figma.com. With a Figma account, you can [create teams](#) – shared spaces, where you can collaborate on files and organize them in projects.

Choose from a free Starter team or a paid Professional team. If you are a student or educator, you can get access to all of Figma's Professional features free.

Frames

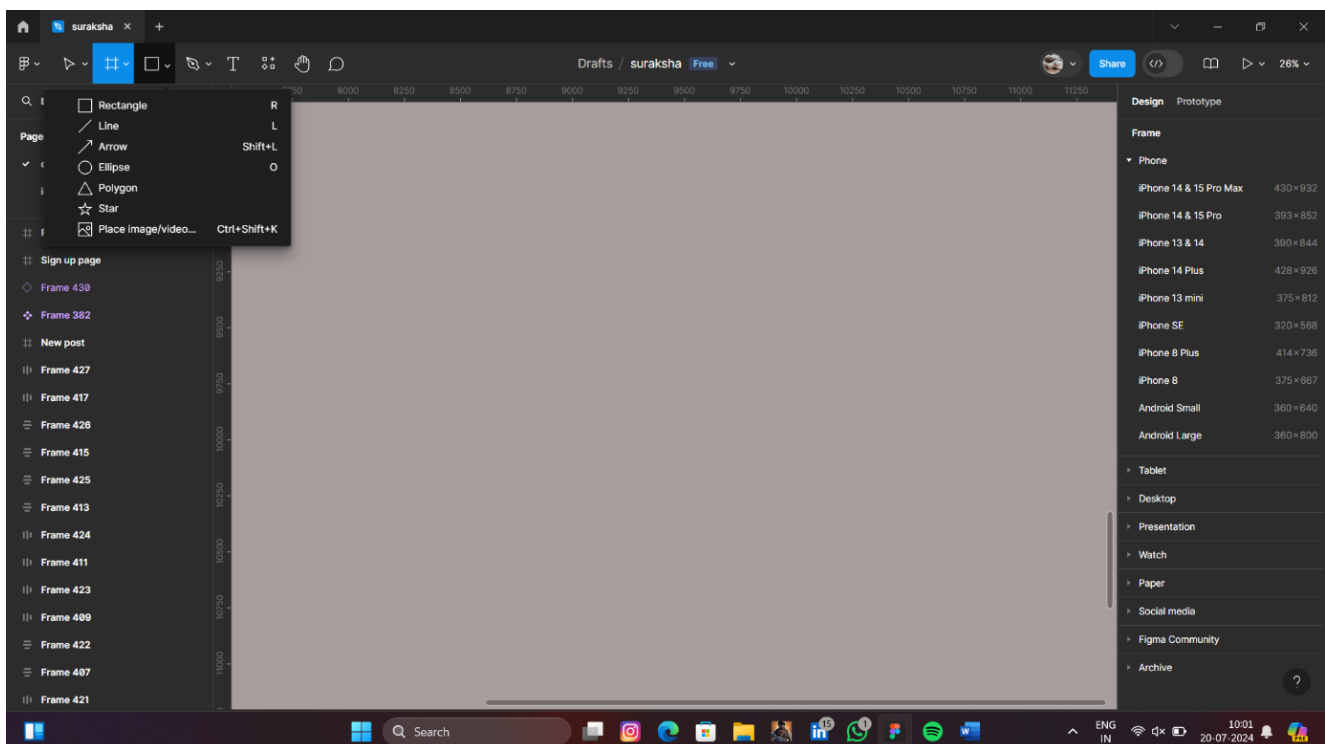

With the great expanse that is the canvas, you need something to put your designs in. Enter frames. Frames are the containers you place your shape, text, and image layers in. You can think of each frame in the canvas as a single screen of your design.

Create Shape

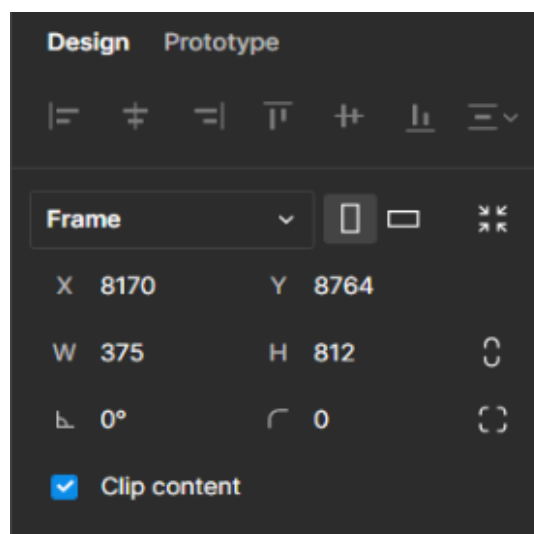

Now you're ready to add some layers to your frame! As this is a wire frame, you can use shapes, like rectangles and ellipses, to represent more complex aspects of the design.

- Select the rectangle tool to create an image for a post on your app's home page.
- Just like frames, every layer in the canvas has dimensions. You can adjust a layer's position and dimensions in a few ways.

Position

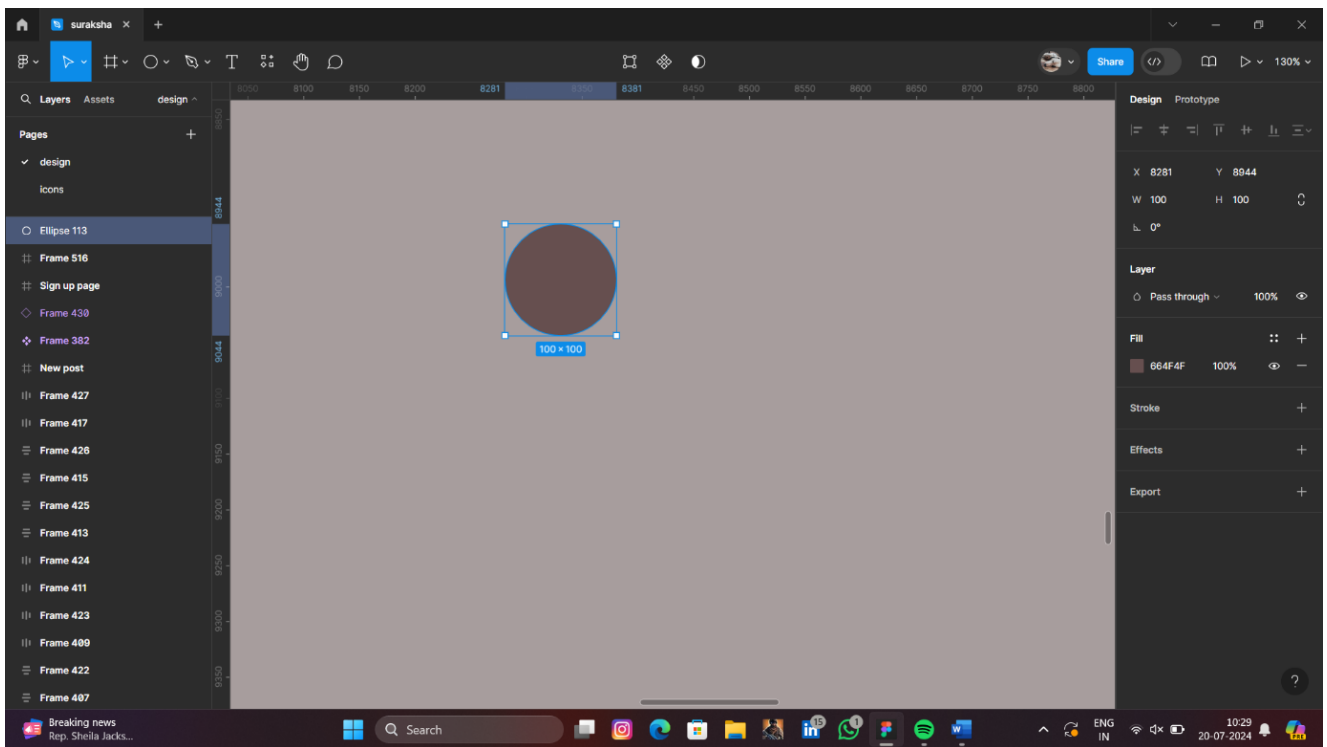

- Click and hold on the layer you want to reposition. Drag the layer to the part of the canvas you'd like to position it on. Release to apply.
- To set specific co-ordinates, you can update the X and Y fields for the layer. These co-ordinates correspond to the top-left corner of the layer.
- To set specific dimensions, you can update the layer's dimensions using the width (W) and height (H) fields in the right sidebar.

Make an avatar

Now we're going to create a shape that represent a user's profile picture, or avatar.

1. Select the ellipse tool in the menu and click to start drawing the ellipse.
2. Hold down Shift as we drag to create a perfect circle. This also constraints.
3. Release to create the avatar with dimensions of around 30 by 30.

Colors or Paints

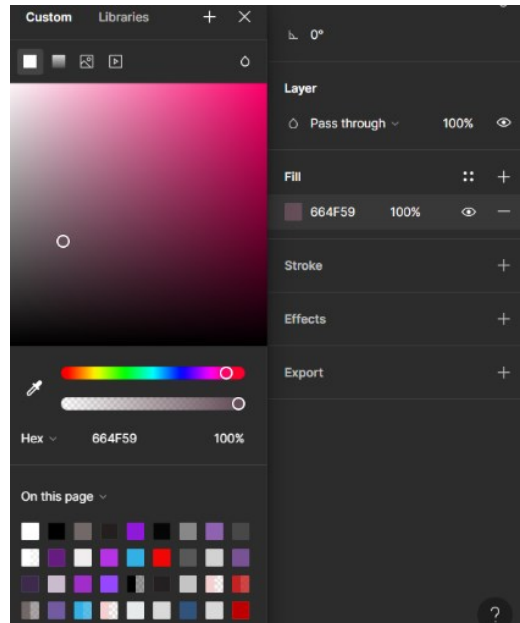

New shape layers have a gray fill by default, but we can apply another color or paint to these layers. Paints can be solid colors or gradients, as well as images or animated gifs.

You can apply paints to fill stroke, or effect properties of a layer. You can even add [more than one paint to a layer](#) and [use blend modes to create unique styles or effects](#).

Paints appears similarly in the right sidebar:

- Preview a swatch of the color or a thumbnail of the image or GIF.
- View the opacity of the paint applied to this layer.

- See the hex color code for solid colors and gradients, or a generic image or GIF label.
- Enter a hex code in the field, Select colors from the palette, or apply other fills, like images, and even animated GIF's.
- Click to remove fill.

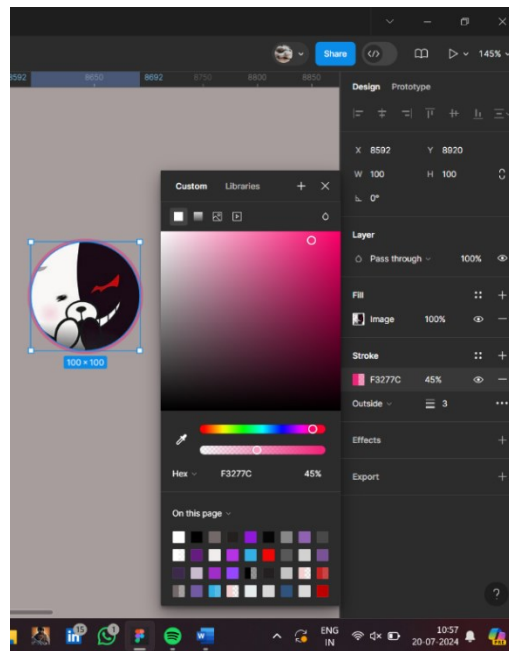

Stroke properties

We want our wireframes to appear like outlines instead of solid shapes. We can do this using the stroke property. Strokes work like outlines or borders around our shapes and layers.

1. Select both shape layers.
2. View the Fill and Stroke properties in the right sidebar.
3. Click under Stroke to add a stroke to the layer.
4. Click next to an existing Fill to remove the fill.

Adjust the color of the stroke:

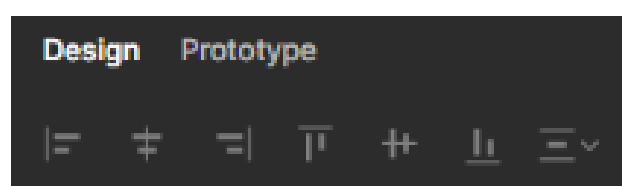

- Enter a hex code directly in the field.
- Click the swatch to open the color picker. Select colors from your palette or apply others paints, like images, and even animated GIF's.

Align siblings

We've learned how to align layers to their frames, but we can also align layers to each other.

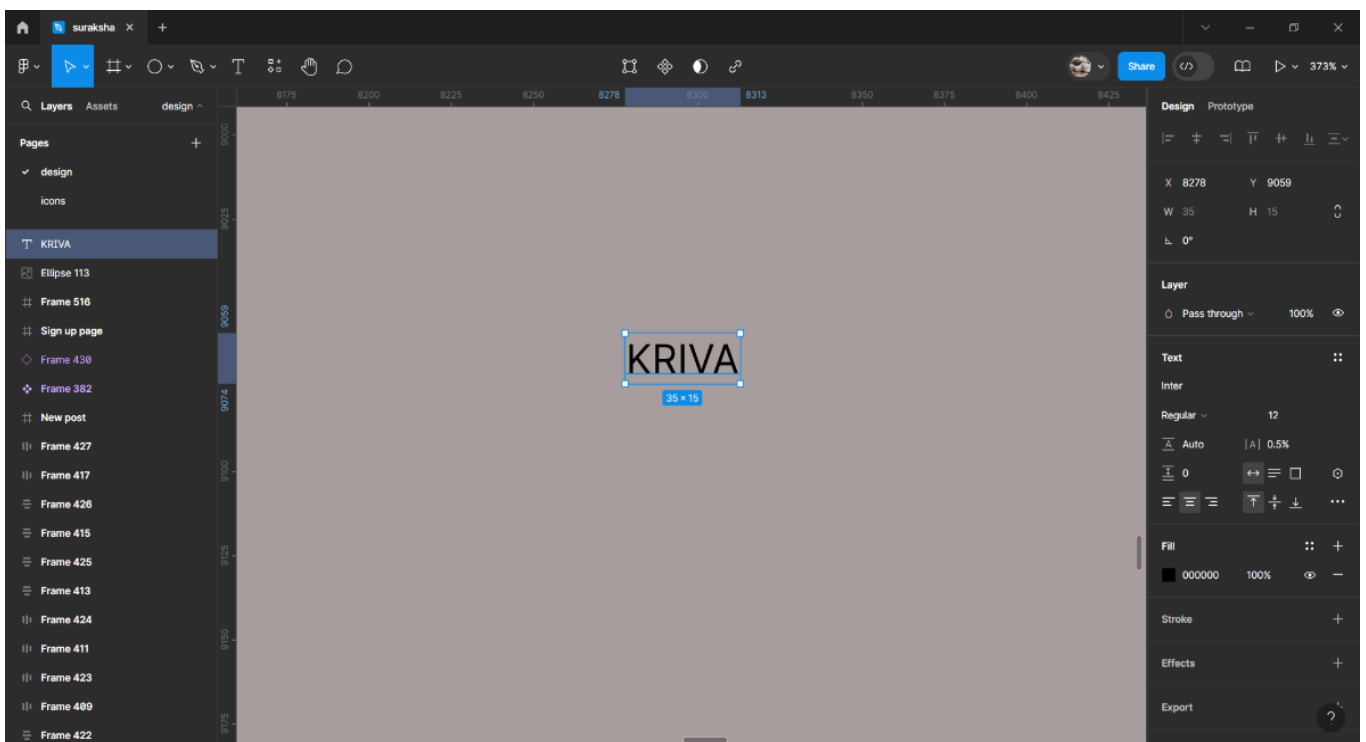

1. With the layers already selected, Click align left.
2. As the dimension of the avatar layer are smaller, Figma will move this layer so it aligns with the larger image 1

Text

Now we need a username to go with our avatar. We'll create a default text layer now and cover adjusting text properties later in series.

1. Select the text tool in the tool bar.
2. Click on a spot in the canvas next to our avatar to create a text layer.
3. Type in **name** as our place holder text.
4. We want our text layer to align with the center of our avatar. Click on an empty spot in the canvas and drag your cursor to select multiple layers.
5. We want our text layer to align with the center of our avatar. Drag over multiple layers to select them at once, and click [Align](#) vertical center.
6. We'll also need some text below our image. Press T to select the text tool and click and drag to create another text layer.

Icons

Visual communication

Icons help convey complex information in a concise and easily digestible format.

Navigation

Icons aid in navigation making it easier for users to find what they're looking for.

Visual appeal

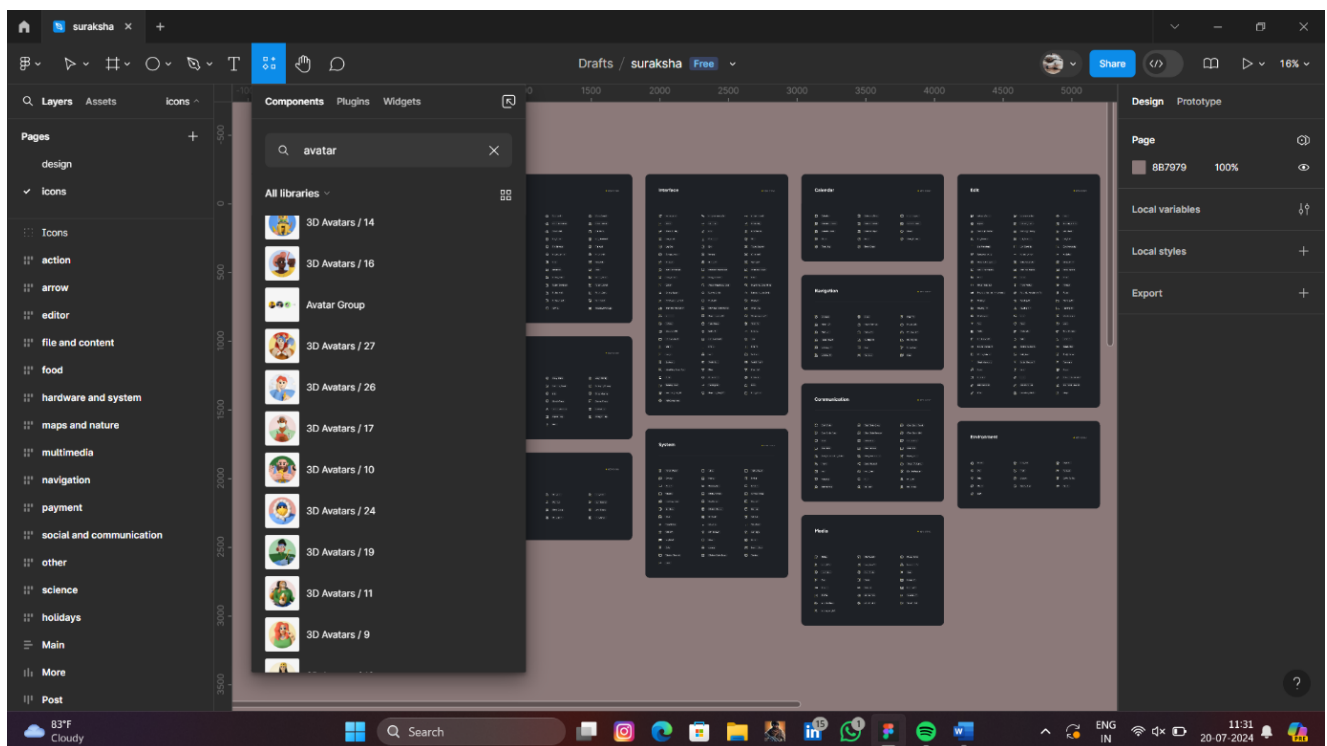

Icons add visual interest and beauty to the app designing.

Branding

Icons can be used to reinforce the app brand identity.

Accessibility

Icons can help users with visual impairments by providing a visual representation of information.

App Design (Instagram)

- Instagram is a popular social media platform that allows users to share photos, videos, and stories with their followers
- It is one of the most widely used social networking services worldwide.
- Instagram is known for its emphasis on visual content and features like filters, hashtags, and explore page to discover new content.

Instagram's core features

- **Photos and videos sharing:** Users can post photos and videos from their mobile devices.
- **Stories:** Instagram stories allow users to share photos and videos that disappear after 24 hours.
- **Explore Page:** This page suggests photos and videos that users might like based on their interests and the accounts they follow.
- **Direct Messaging:** Users can send private messages, photos, and videos to each other through Instagram.
- **Hashtags:** Users can add hashtags to their posts to categorize them and make them discoverable by other users interested in similar topics.
- **Filters and Editing Tools:** Instagram offers various filters and editing tools to enhance photos and videos before posting.
- **Live streaming:** Users can go live and broadcast to their followers in real-time.

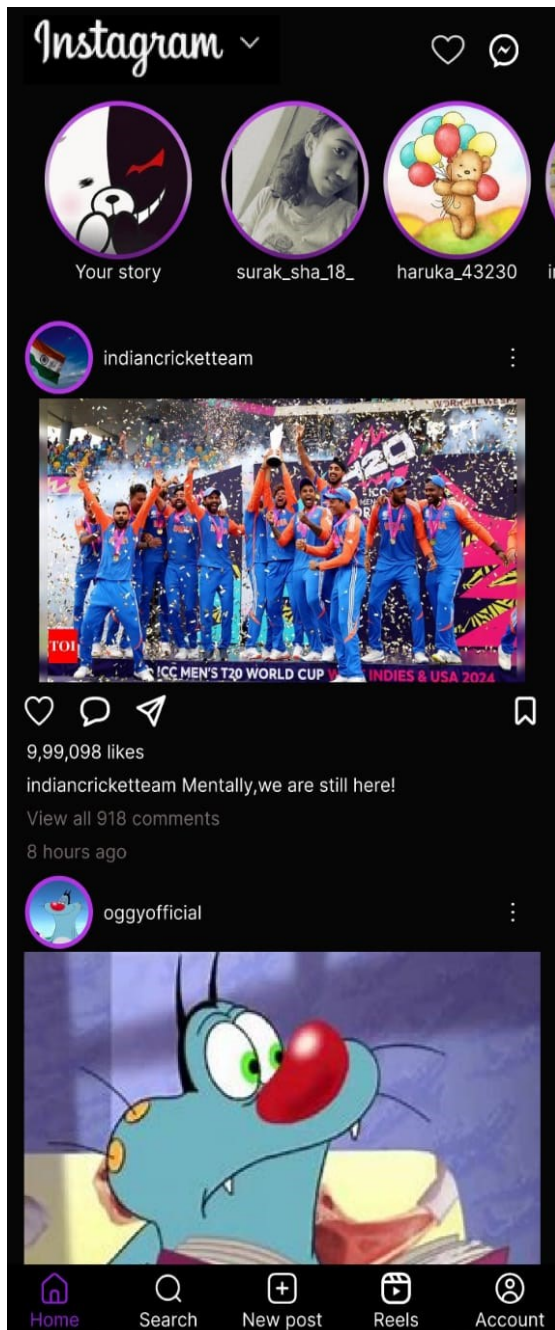

- **Feed Posts:** Users can upload photos and videos to their profile, which appear in their follower's feed.
- **IGTV:** Instagram Tv allows users to upload longer videos (up to 1 hour) compared to regular posts, typically used for episodic content.
- **Reels:** Short, entertaining videos (up to 60 seconds) with audio, effects, and new creative tools for editing.
- **Analytics:** Instagram provides insights and analytics for business accounts, offering data on impressions, engagement, and audience demographics.
- **IG Guides:** Allows users and brands to share in-depth content in a curated, easy-to-digest format, focusing on recommendations, tips, and advice.

Home Page of Instagram

Home page is also called Instagram feed. It's where you see and scroll through posts of people and accounts you follow.

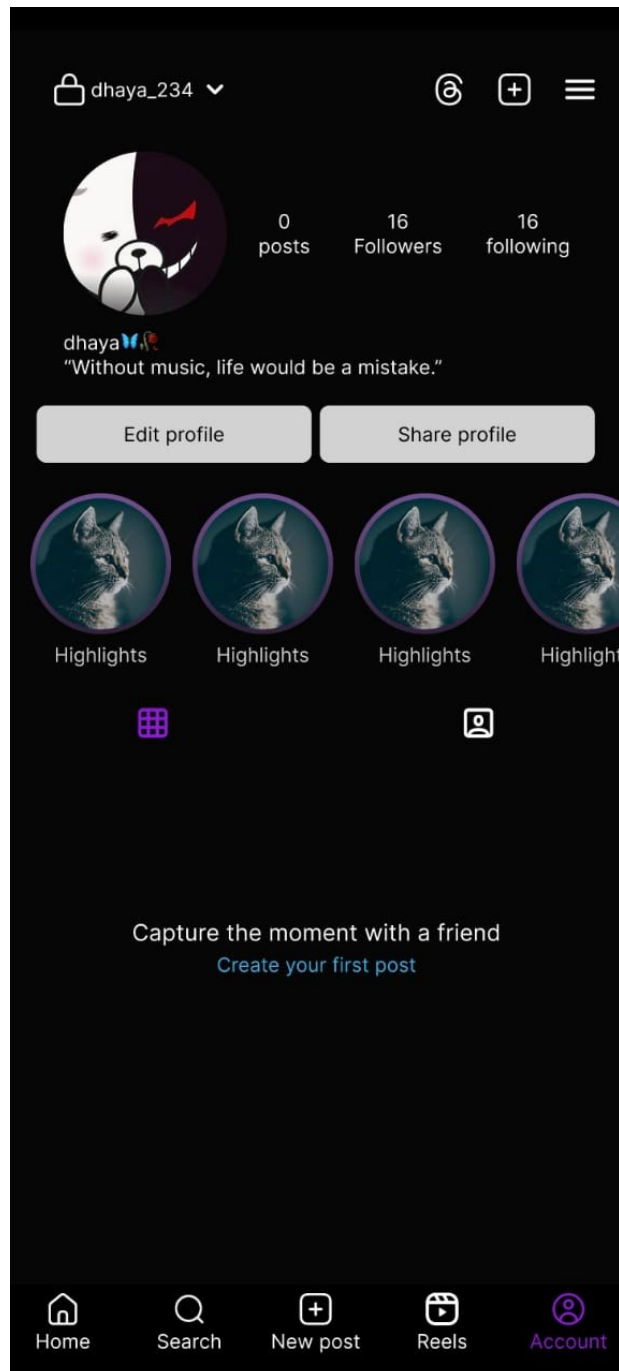

- **Feed:** This is where users see photos and videos posted by accounts they follow, displayed in chronological order or based on algorithms that prioritize content of interest.
- **Stories:** A bar at the top of the feed shows temporary posts from followed accounts, which disappear after 24 hours unless saved as highlights.
- **Explore:** A magnifying glass icon leads to explore page, where users can discover new content and accounts based on their interests and interactions.
- **Direct Messaging:** Users can access their messages and send photos, videos, and texts directly to others.
- **Notifications:** A heart icon displays likes, comments, and other interactions with a user's posts or activity.
- **Profile:** By tapping on their profile picture, users can edit their profile, view their posts, and manage their settings.
- **IGTV:** Instagram Tv is a platform for longer videos, accessible via a button on the homepage or within the Explore section.

Home Page Design

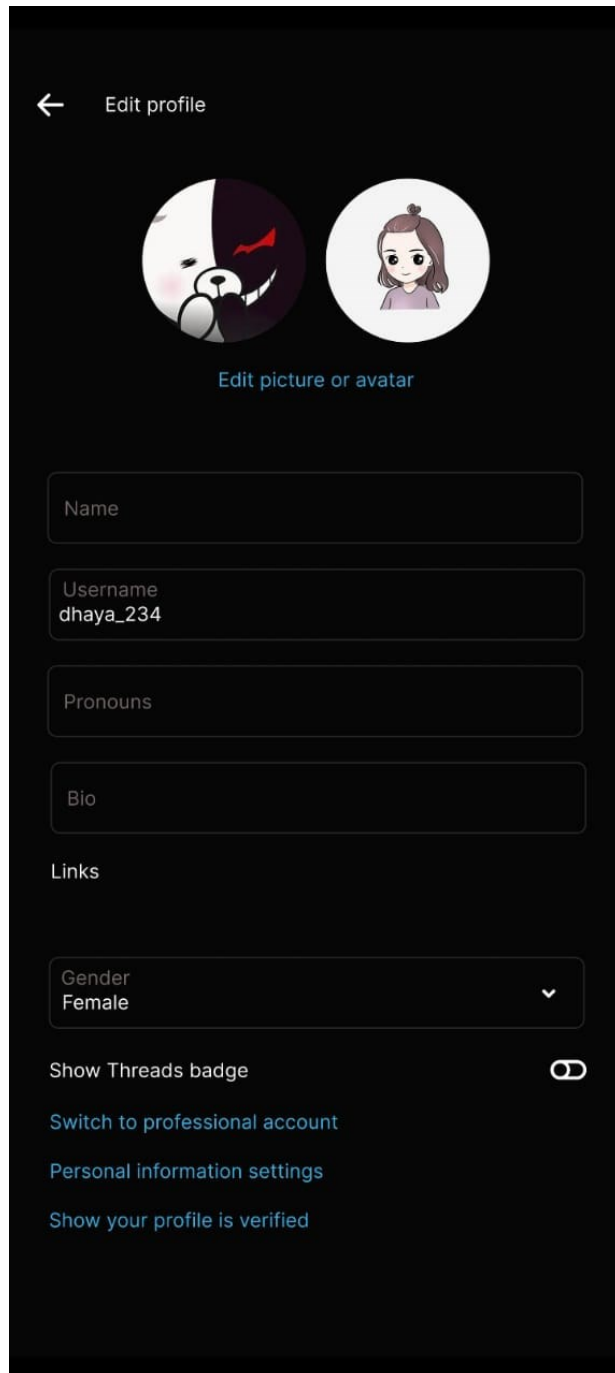

Profile Page

Your profile page is where you can find your photos, videos, and settings on Instagram. Here, you can view what you've shared and you can add bio or website.

Edit Profile Page

Here, you can update Instagram profile information like your name, username, and email. Also can add a website, profile or change current profile on Instagram. Can manage the threads badge in Instagram profile.

[Personal information settings](#)

[Show your profile is verified](#)

Settings Page

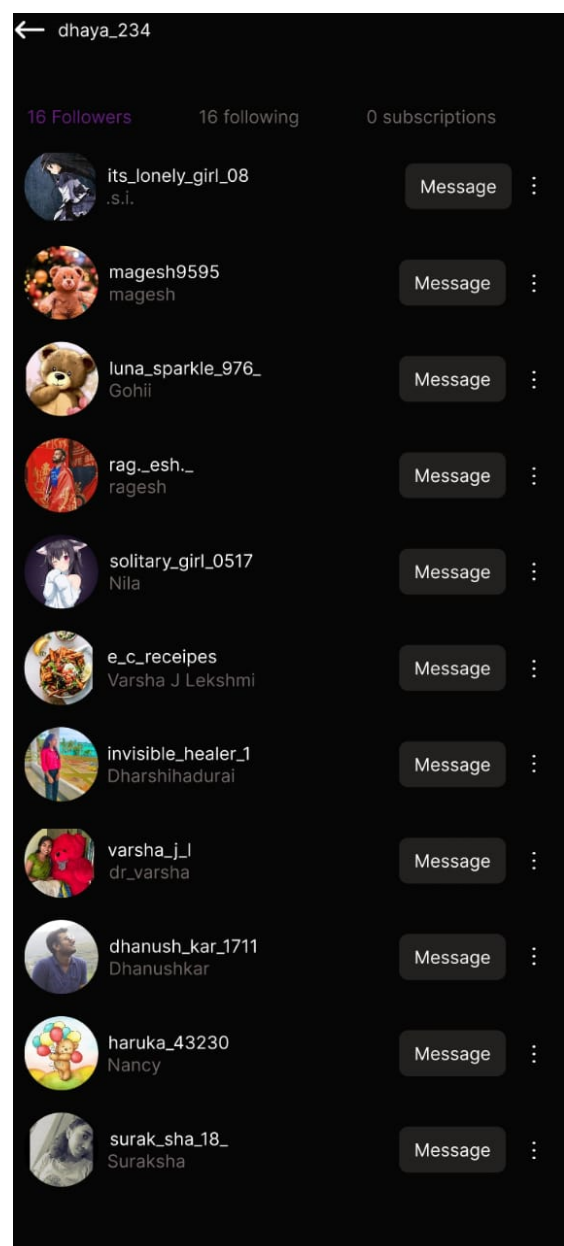

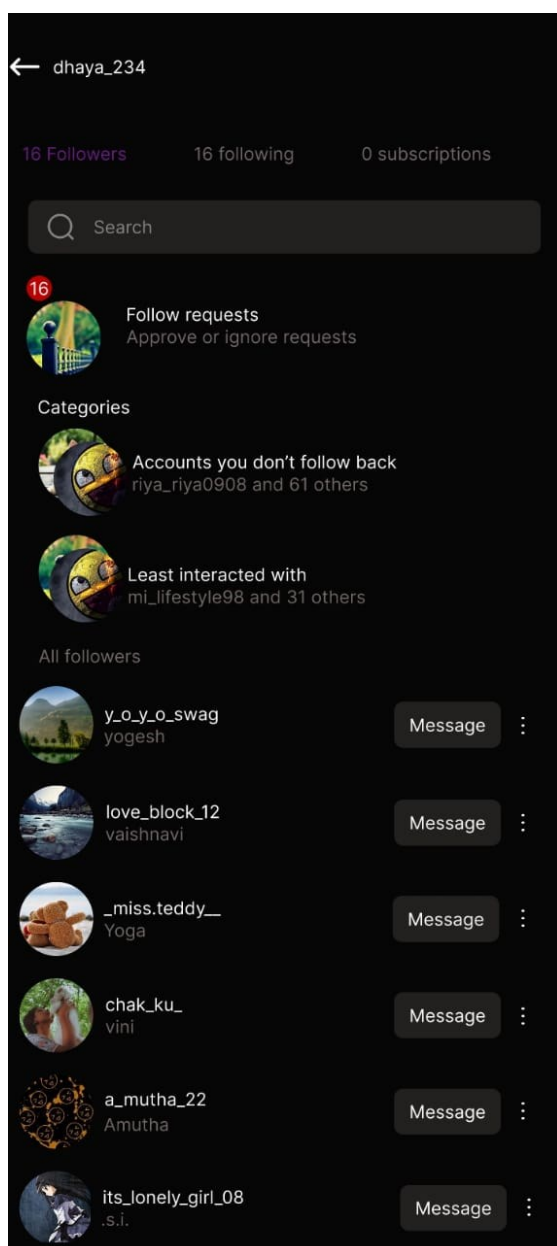

- **Account Management:** You can edit your profile information, change your username, update your bio, and manage linked accounts.
- **Privacy and Security:** Control who can see your posts, who can message you, and who can find you by your contact information. You can set your account to private.
- **Notifications:** You can manage notification preferences, such as receiving alerts for likes, comments, mentions, and new followers.
- **Data and History:** Instagram settings include options to view account data, such as previous searches, activity, and interactions. You can also manage cookies and other browsing data related to your account.
- **Security:** Settings include options for two-factor authentication, which adds an extra layer of security to your account by requiring a code in addition to your password when logging in from an unrecognized device.
- **Accessibility:** Settings may include options for accessibility features, such as text size, contrast, and screen reader compatibility, to enhance user experience for people with disabilities.

Settings Page Design

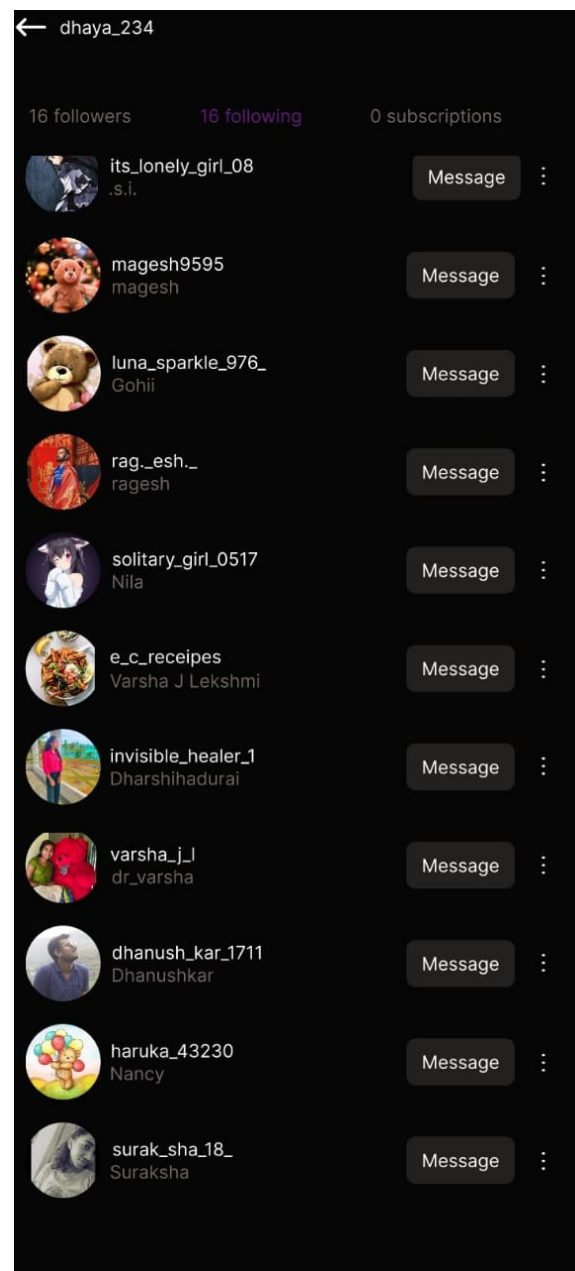

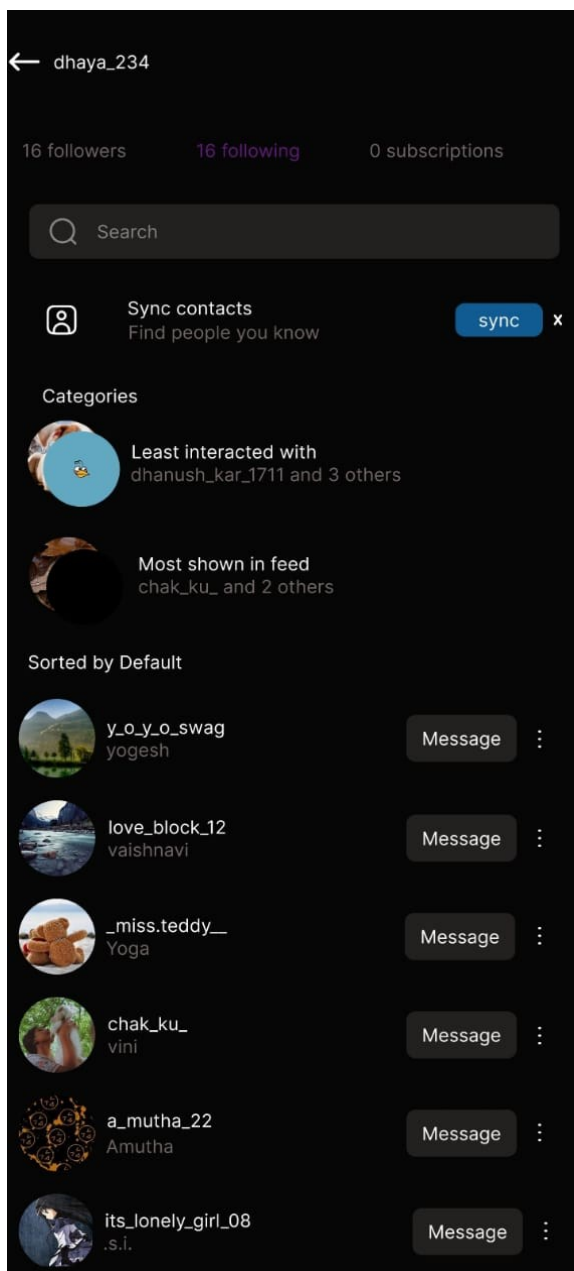

Followers page

Instagram typically shows your followers in your profile section where you can see total number and also the list of individual followers if your account settings allow it. You can access this page by tapping on your profile picture or your profile icon, then selecting “Followers”. Here, you’ll see a list of all the accounts that follows you.

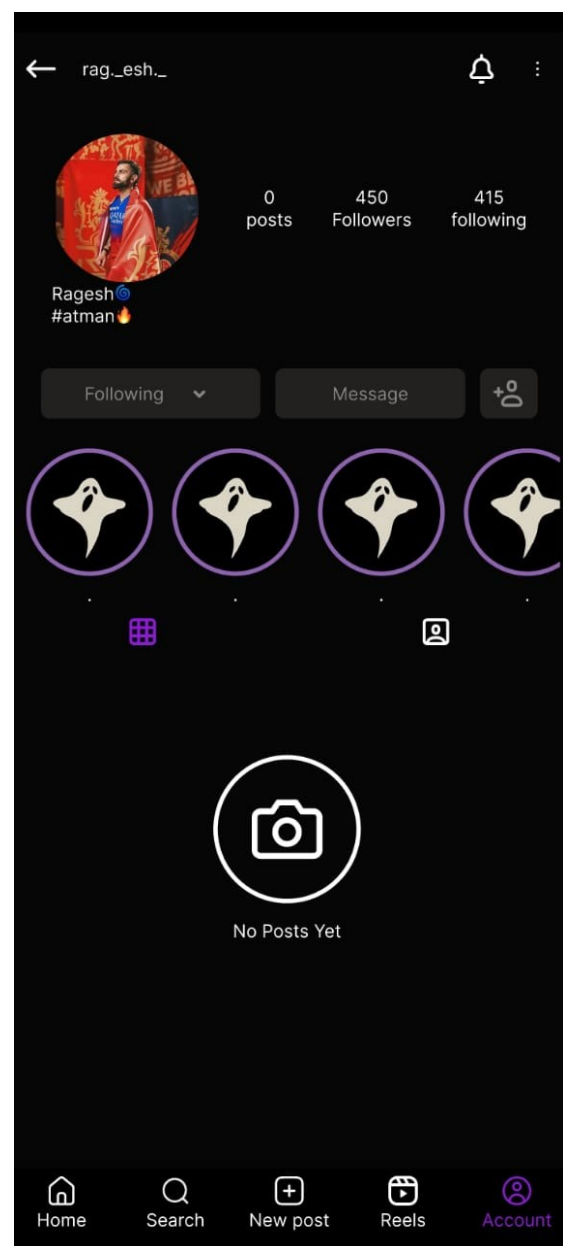

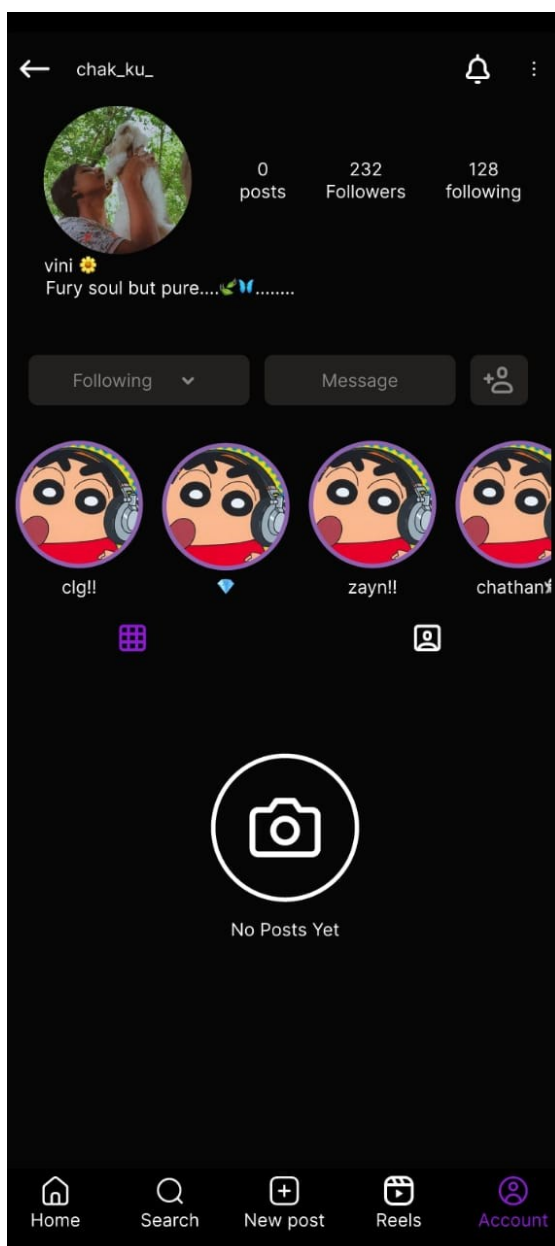

Following Page

The “Following” Page on Instagram shows you the accounts that you are following. You can access this page by tapping on your profile picture or your profile icon, then selecting “Following”. Here, you’ll see a list of all the accounts you follow.

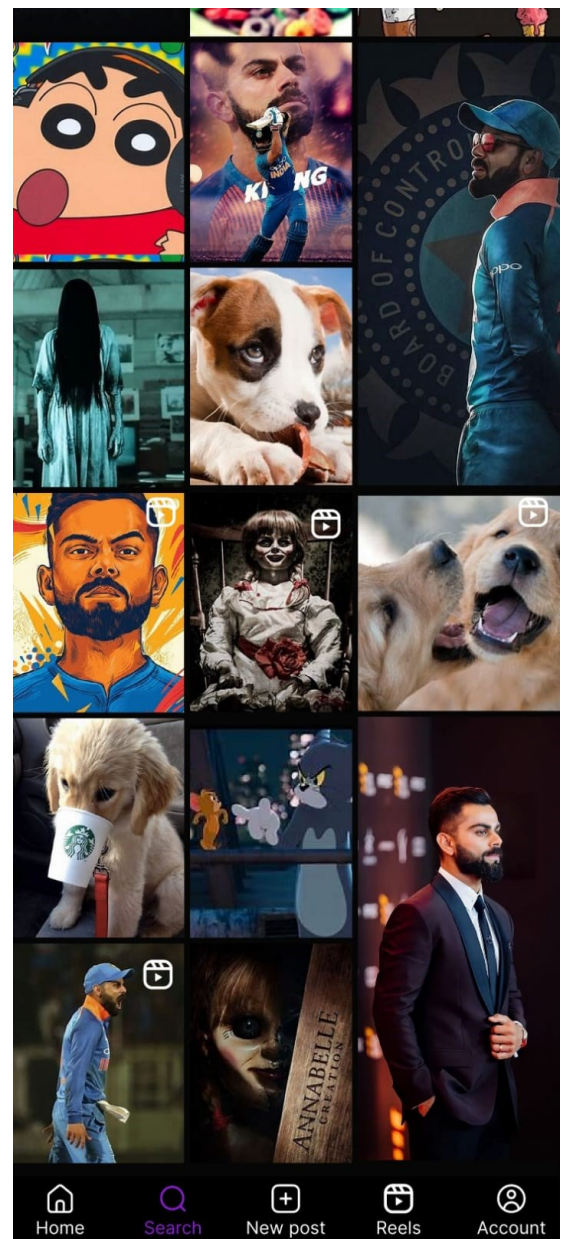

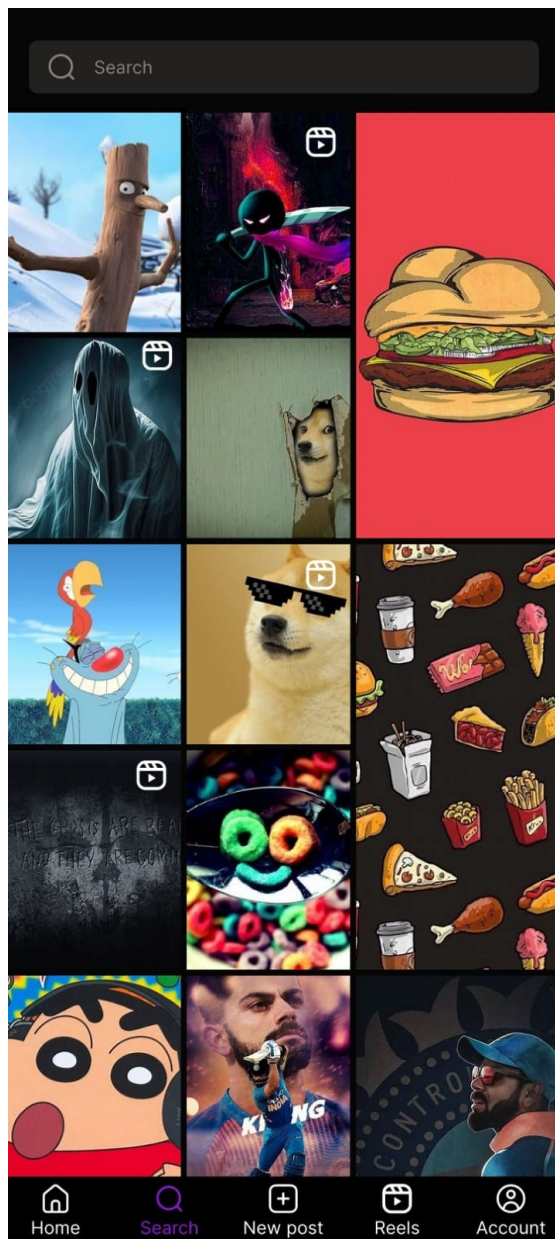

Follower's Account Page

In the follower's page there is a list of followers, tap the account of the follower to view the follower's account page.

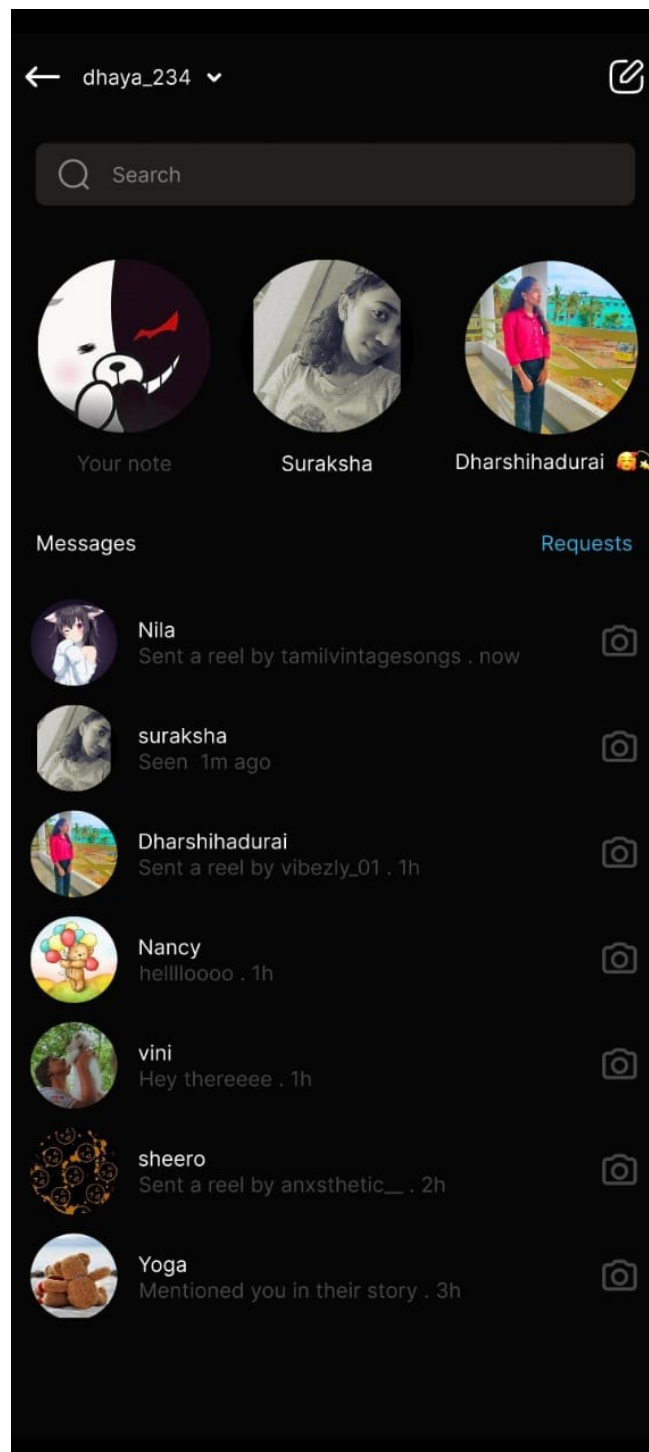

Explore Page

The explore page on Instagram is a collection of content based on user's individual interest.

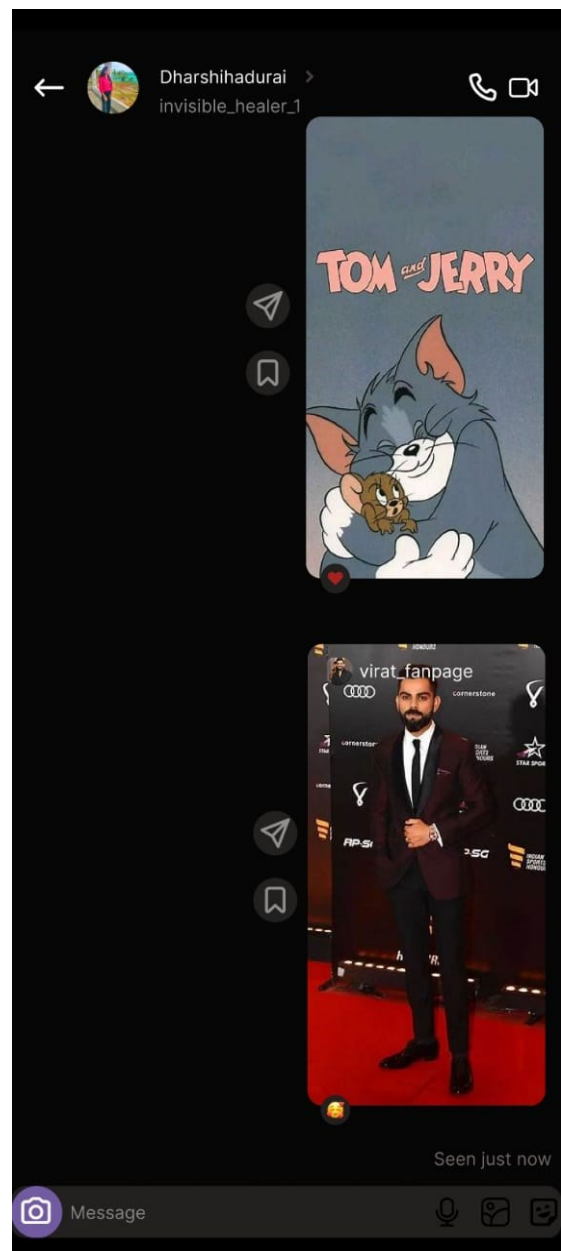

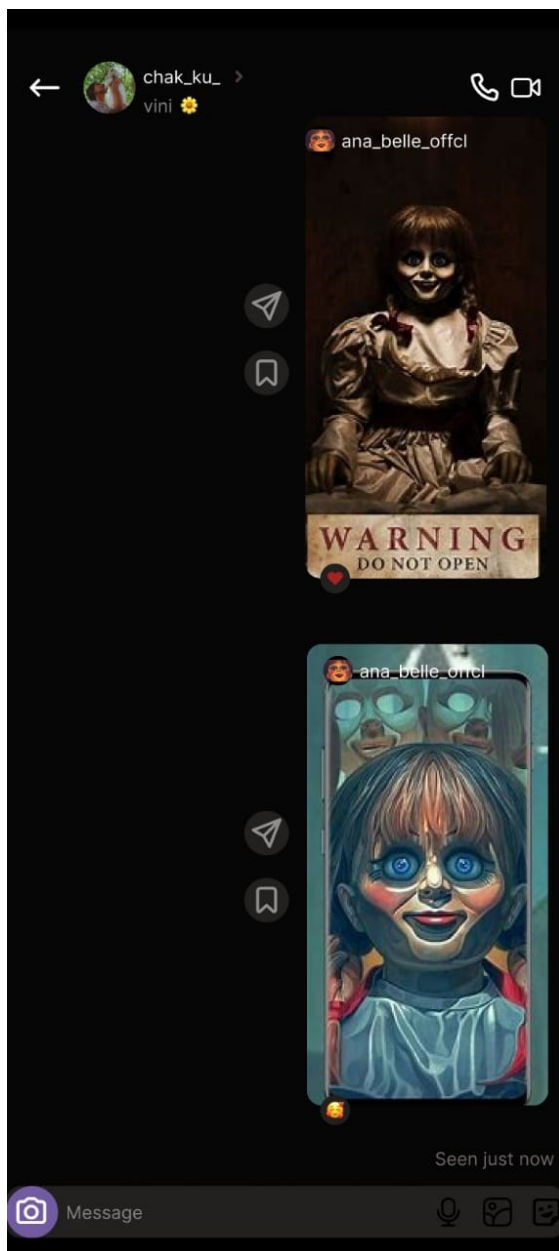

Direct Messaging

Direct Messaging in Instagram allows you to privately exchange text, photos, posts, and stories with one or more. With Instagram Direct, you can spark Discovery, and strengthen relationships.

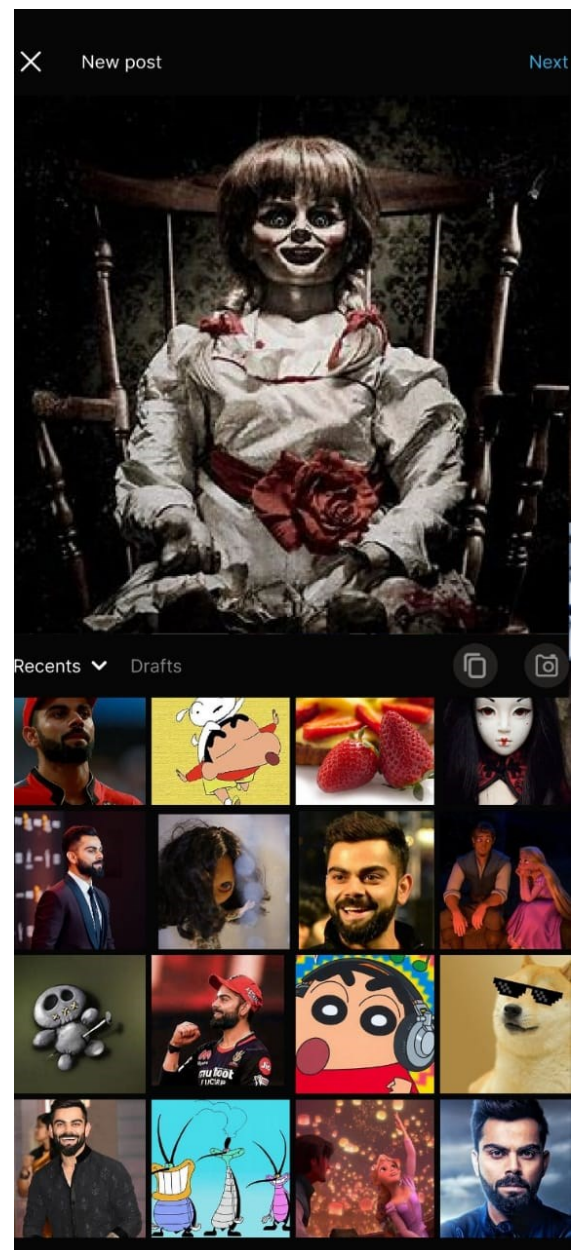

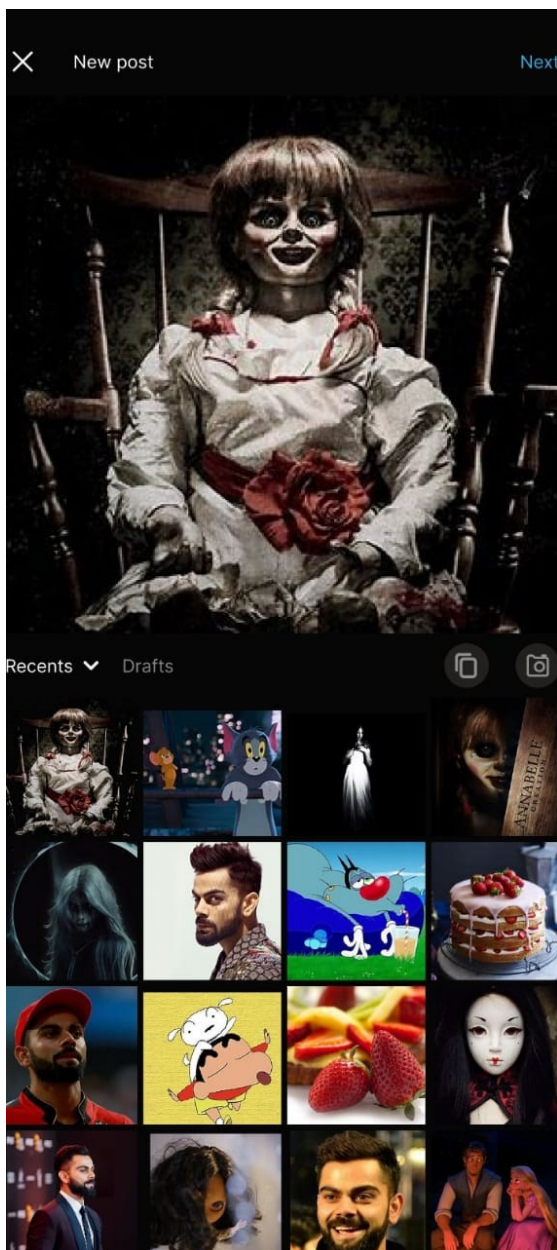

Chats

Instagram lets you send messages to one or more people in chats. These messages can include text and photos or videos you take or upload from your library. You can also send the following things as a message: Posts you see in feed.

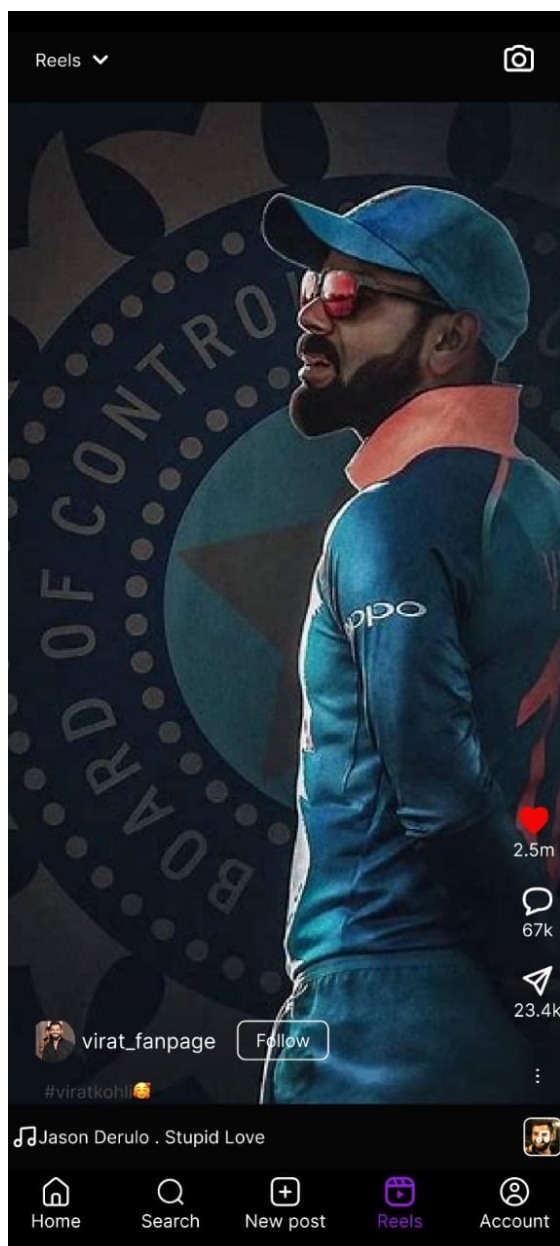

New Post Page

It allows you to create a new post. Choose the media you want to share from your phone's gallery. Instagram offers various filters to enhance your photo or video. You can write a caption that describes your post. You can also mention people using '@' and add hashtags to increase visibility.

Reels Page

The reels page on Instagram is a section of the app dedicated to short-form videos, typically 15 to 60 seconds long. The reels page is designed to showcase viral and popular videos from accounts you follow and those recommended based on your interests. It's a platform for users to create, share, and explore entertaining videos within the Instagram ecosystem.

8. Component

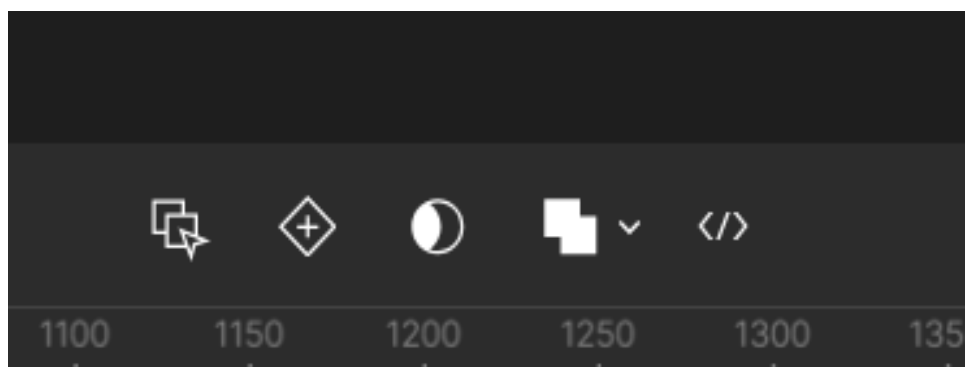

Components are elements you can reuse across your designs. They help to create and manage consistent designs across projects.

You can create components from any layers or objects you've designed. These could be a whole range of things like buttons, icons, layouts, and more.

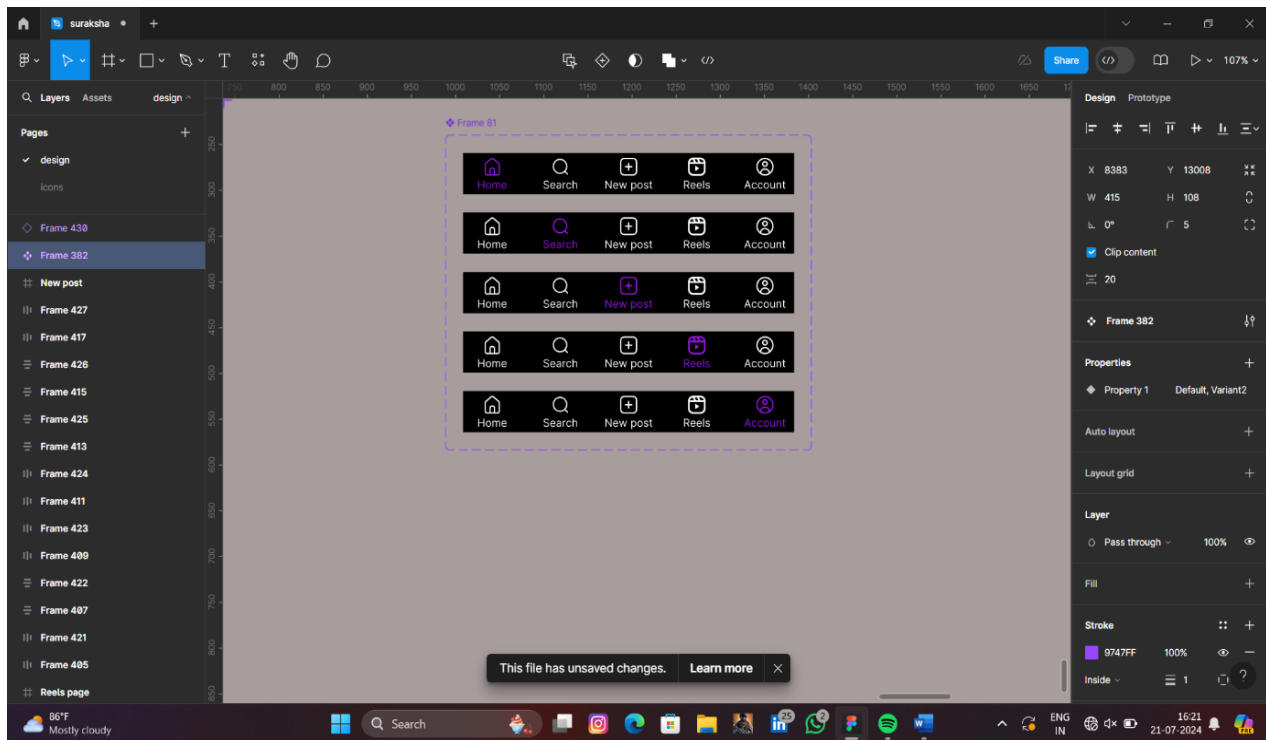

There are two aspects to a component:

1. A main component defines the properties of the component.
2. An instance is a copy of the component you can reuse in your designs. Instances are linked to the main component and receive any updates made to the component.

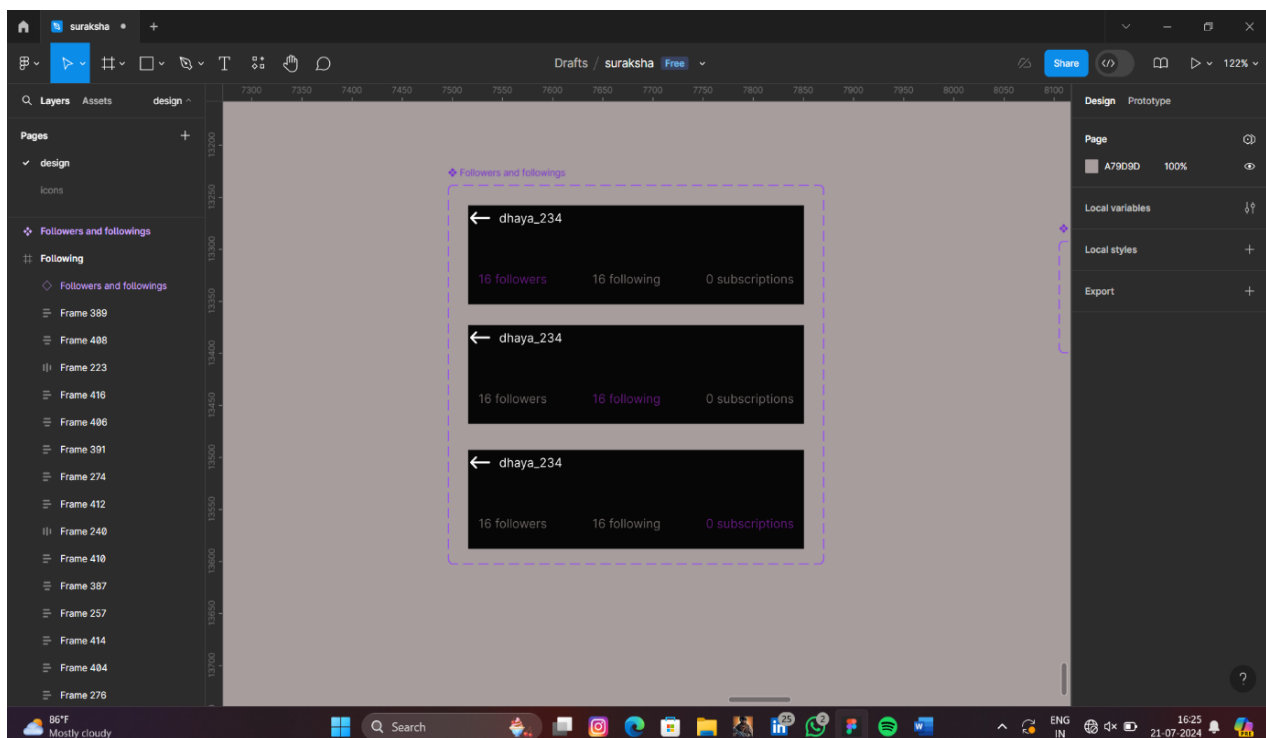

Component is a cloud based UI/UX design tool that offers various component to help design create and collaborate on design

9. Prototype

Flow

With prototyping in Figma, you can create multiple flows for your prototype in one page to preview a user's full journey and experience through your designs.

A flow is the network of frames and connections in a single page. A prototype can map out a user's entire journey through your app or website, or it can focus on a specific segment of it via its own flow. Within the prototype, you have flows for creating an account, adding items to a cart and checking out.

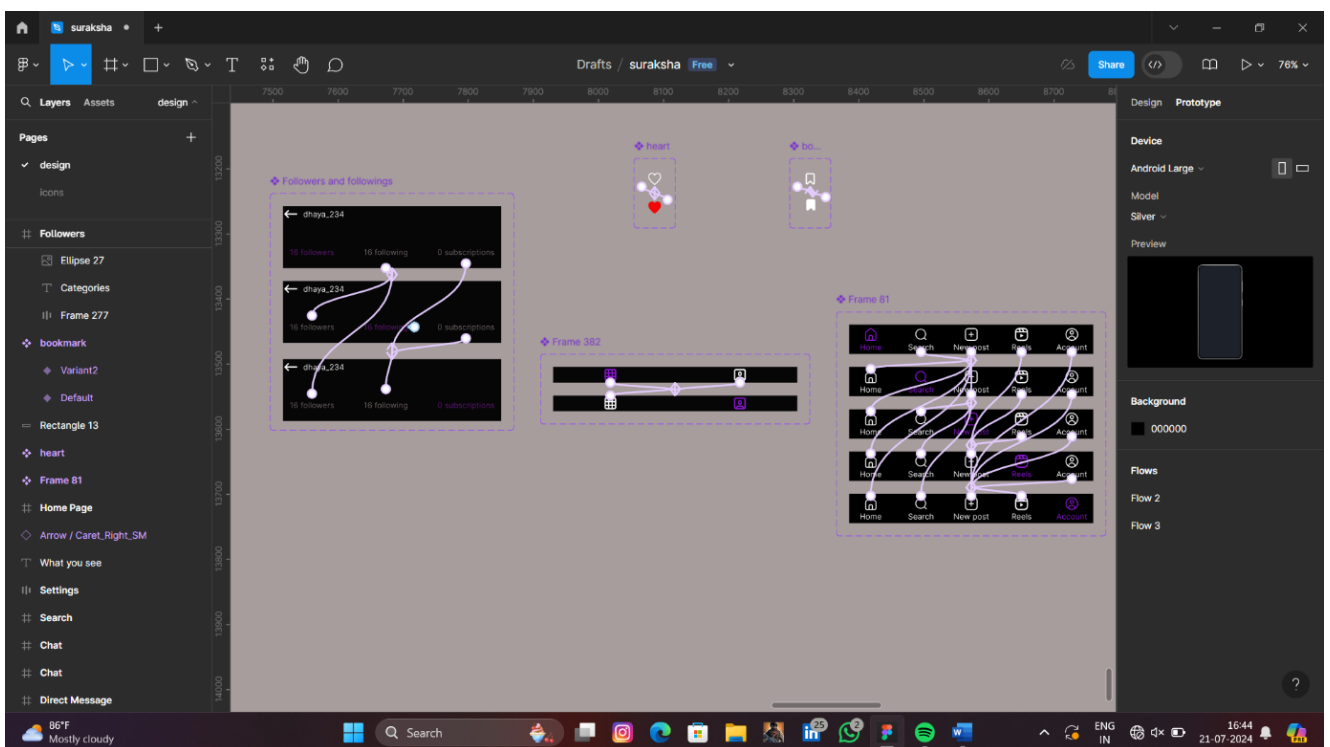

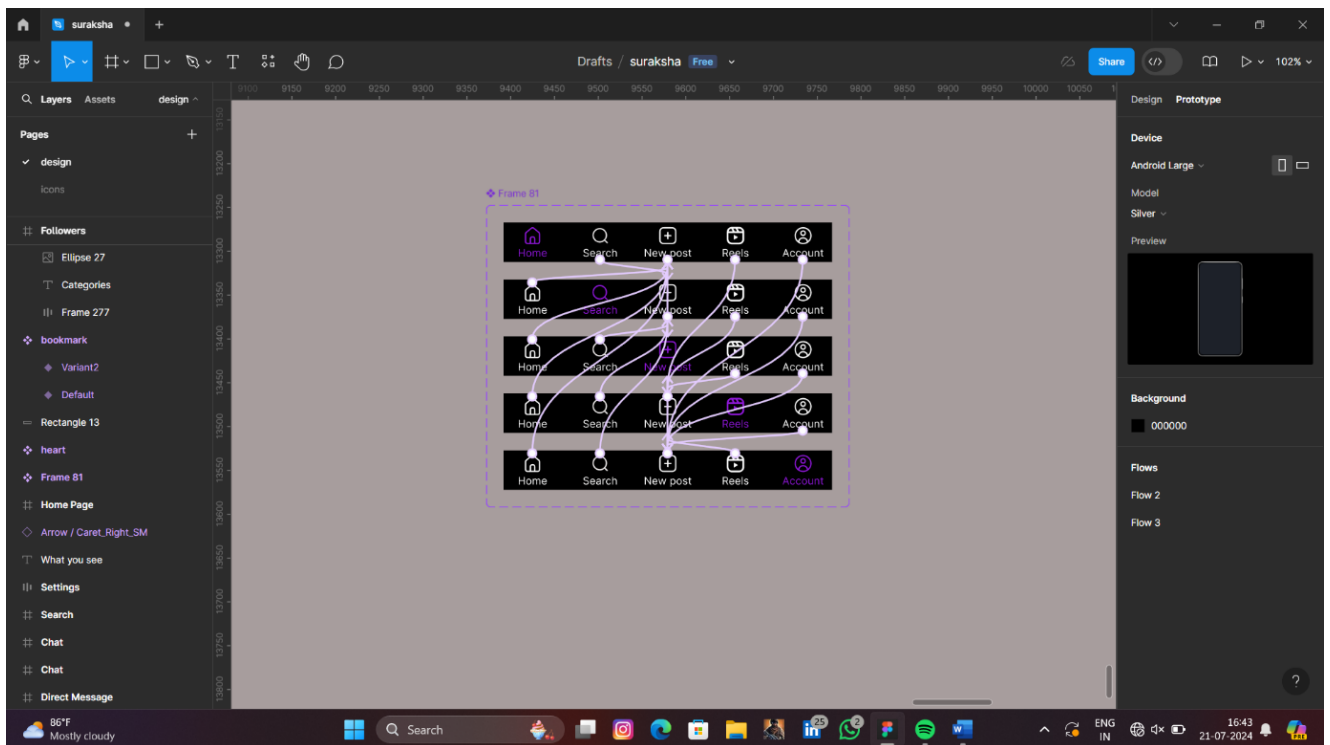

Figma creates a flow starting point when you add your first connection between two frames. There are a few other ways to add a flow starting point to your prototype:

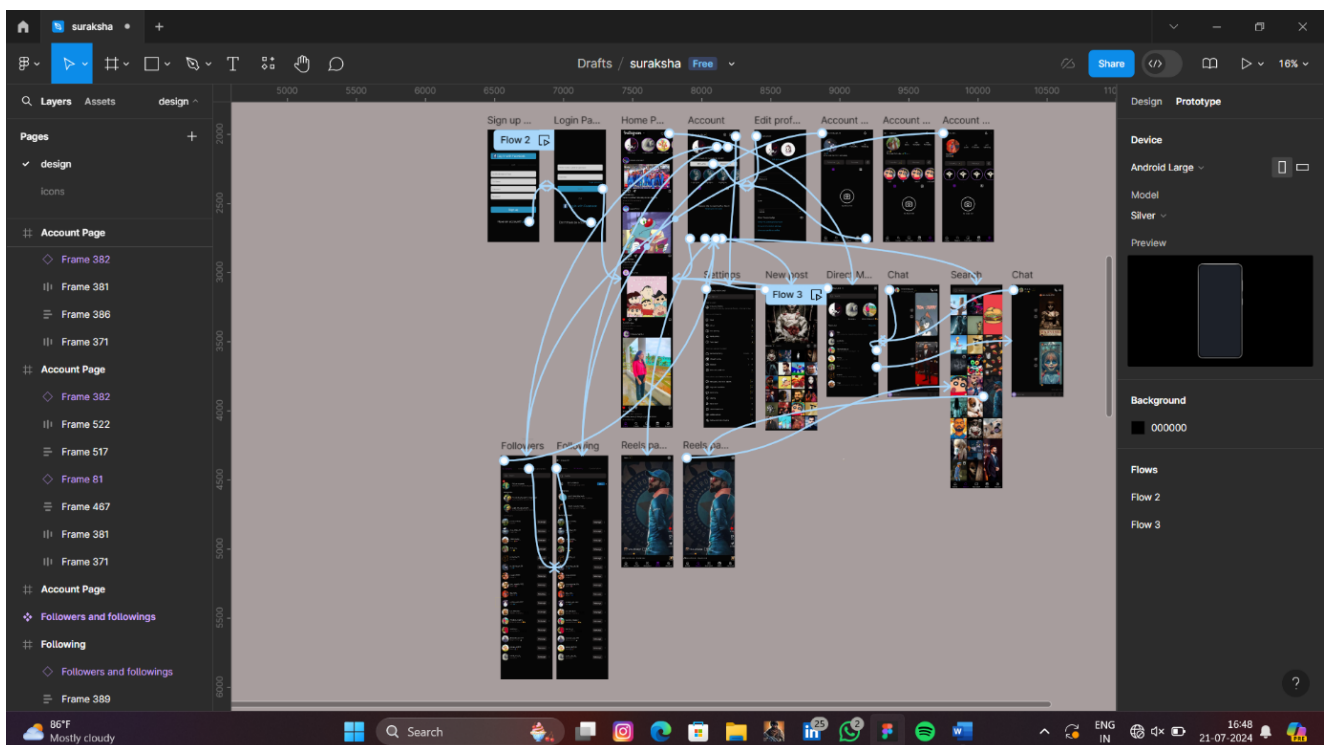

- With starting frame selected, click in the flow starting point section of the right sidebar.
- Right-click on the frame, then click Add starting point.

Create connections

1. Select the hotspot for the connection.
2. Click + to create the connection.
3. Drag it to the destination.
4. If there are no existing connections, Figma will make the first frame a starting point.

Navigation Bar Flow

Scrolling

- Scroll up and down a long page of content.
- Scroll left and right to view different elements in a slider.
- Pan or scroll in any direction, like in an interactive map.
- Fix objects like navigation bars and menus to one position on the page while scrolling.

In order to use scrolling in your Figma prototypes, you must:

- Prepares frame for scrolling: Make sure content extends beyond the bounds of the frame's dimensions.
- Apply scroll overflow to frame: Define if your frame will have vertical, horizontal, both, or no scrolling.

Scroll overflow defines how users can interact with content that extends beyond a frame's dimensions.

Frames for Scrolling

In order to add scrolling behaviour to a frame, the frame must have content that extends beyond the bounds of the frame.

To resize frame:

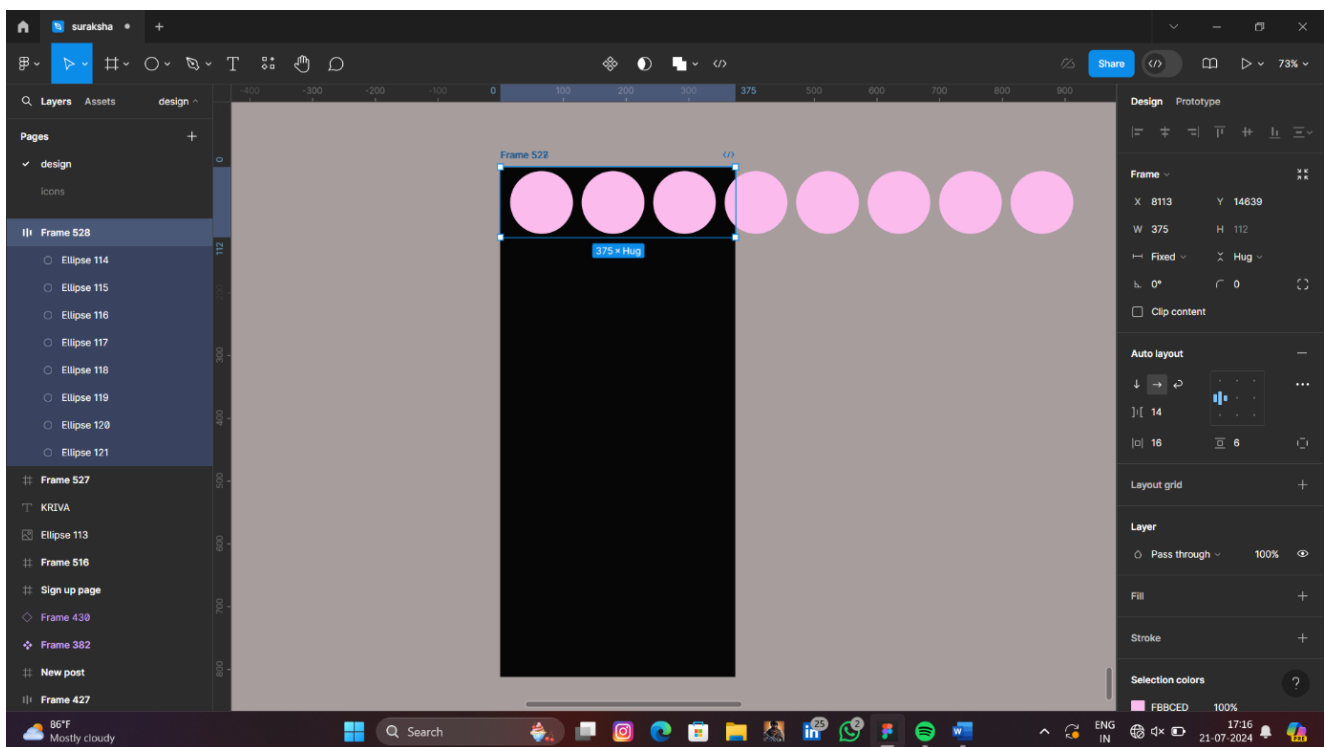

1. Select the frame you want to update.
2. Open the Design panel in the right sidebar.
3. Hover over the frame's edge until the cursor appears.
4. Drag the bounding box to resize the frame.

Clip content

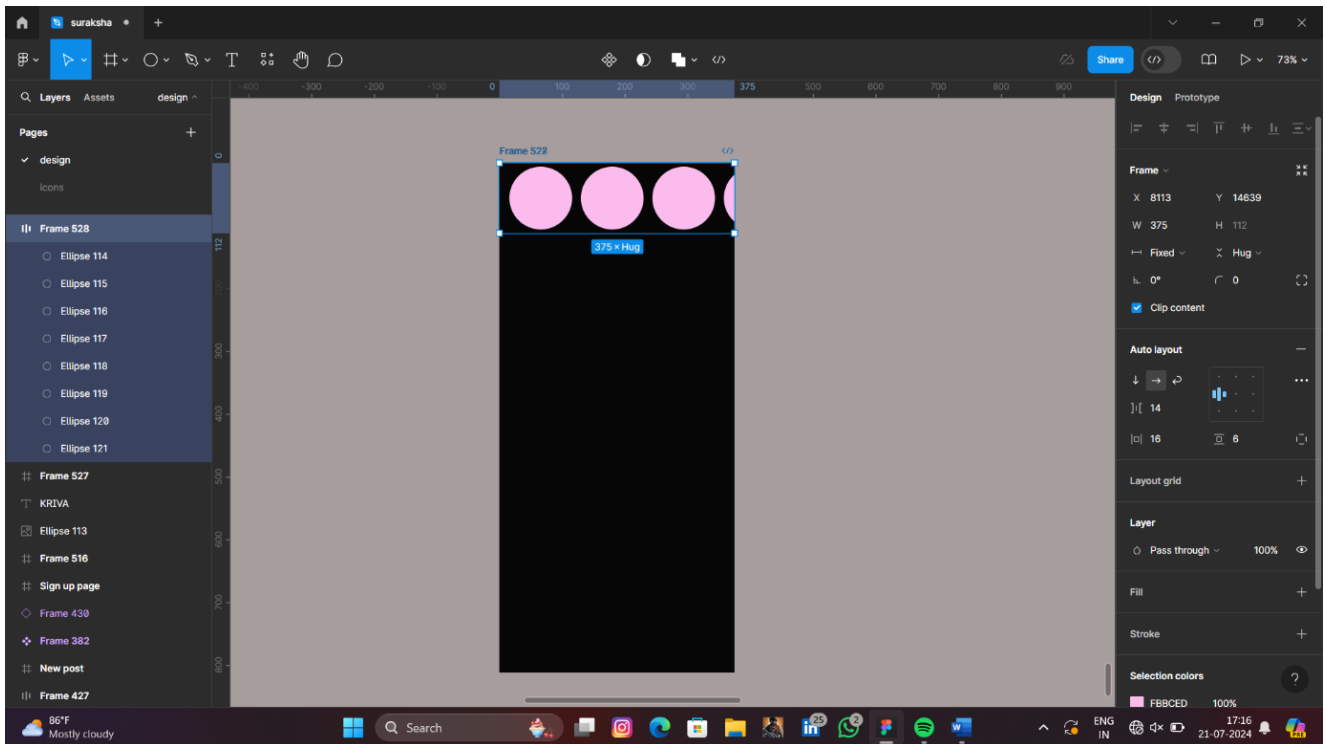

You can hide any content that extends beyond the bounds of a frame with clip content.

1. Select the frame you want to update.
2. Open the Design panel in the right sidebar.
3. In the frame section of the right sidebar, check the box next to clip content.

Before Clip Content

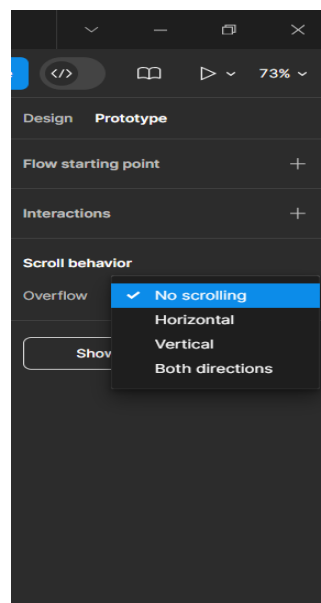

After Clip Content

Apply scroll overflow to frames

You can only apply overflow behaviour to frame. This applies to frames that are directly on the canvas (top-level frames), as well as frames nested within other frames or layers.

To apply scroll overflow to a frame:

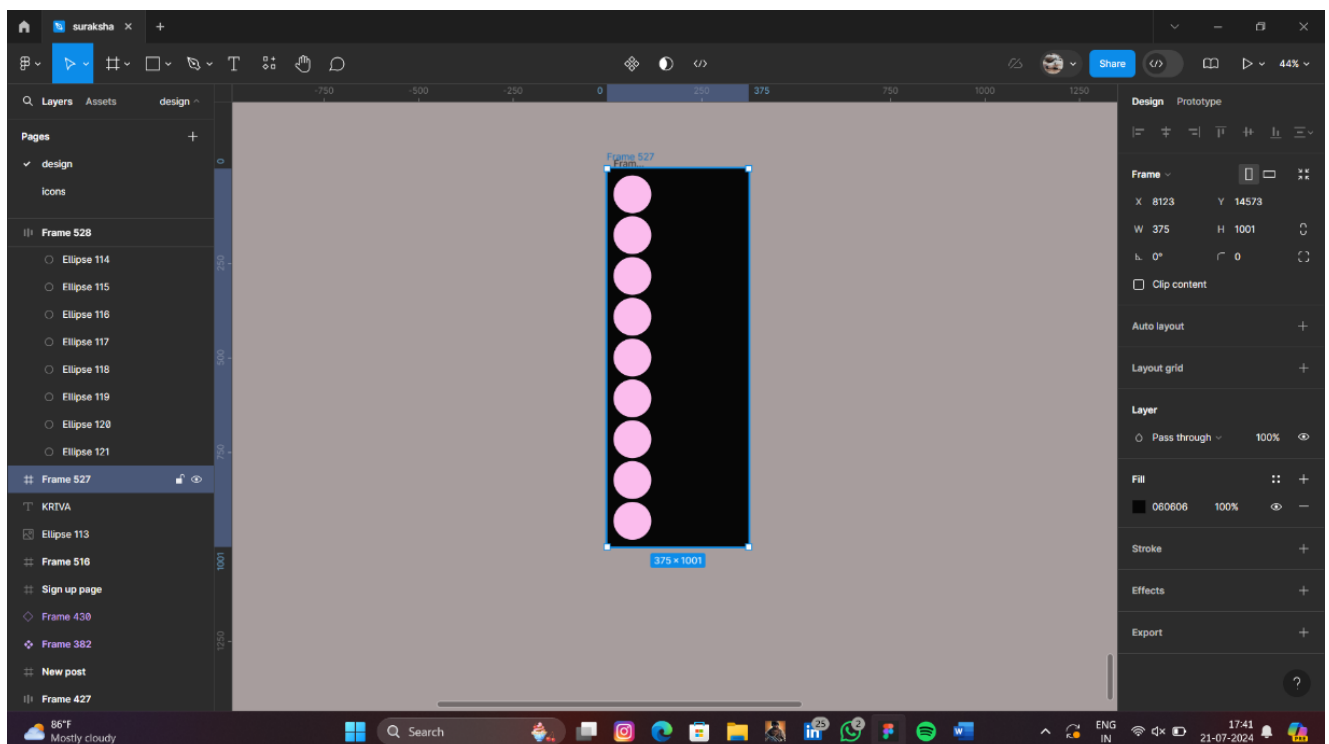

1. Select a frame.
2. Open the prototype panel in the right sidebar.
3. In the Scroll behaviour section, select the Overflow dropdown.

Choose from:

- No Scrolling
- Horizontal
- Vertical
- Both directions

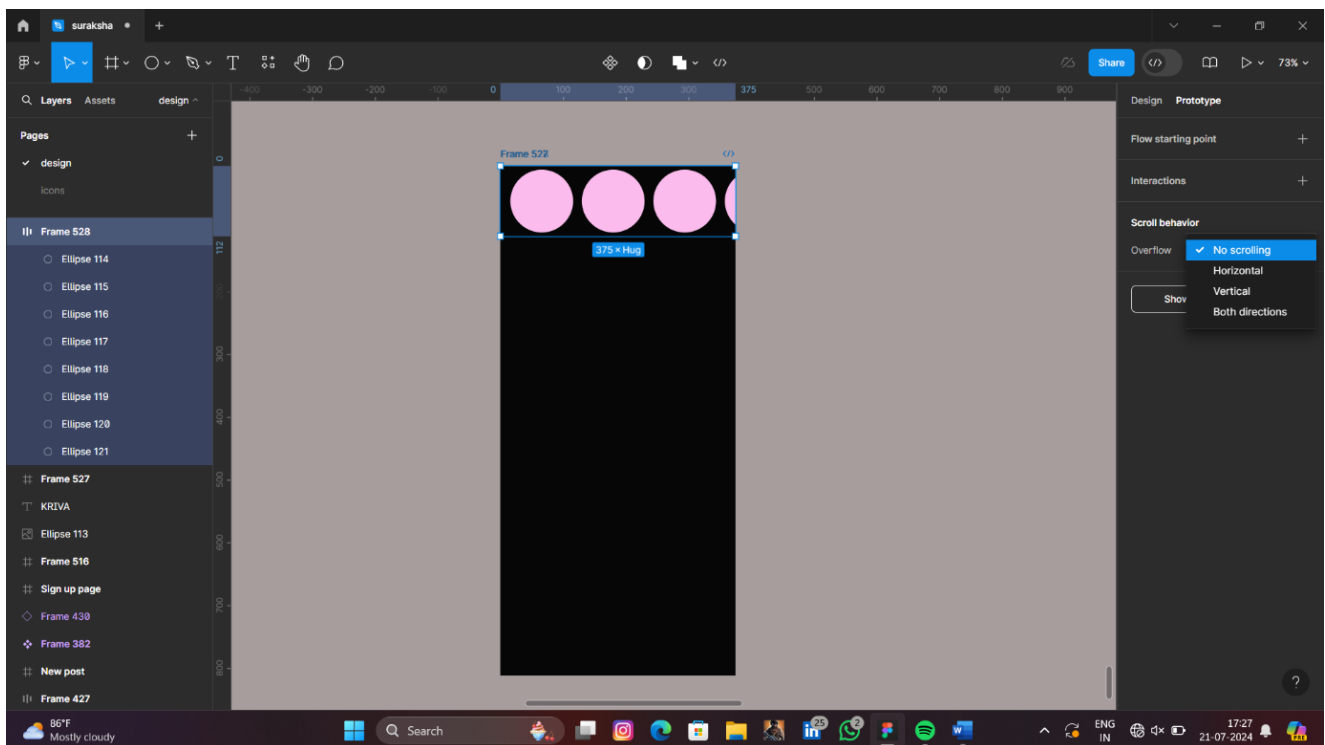

Vertical

Vertical scrolling allows users to swipe or scroll up and down. Use this behaviour to mimic scrolling down a long website, or page of content within an app.

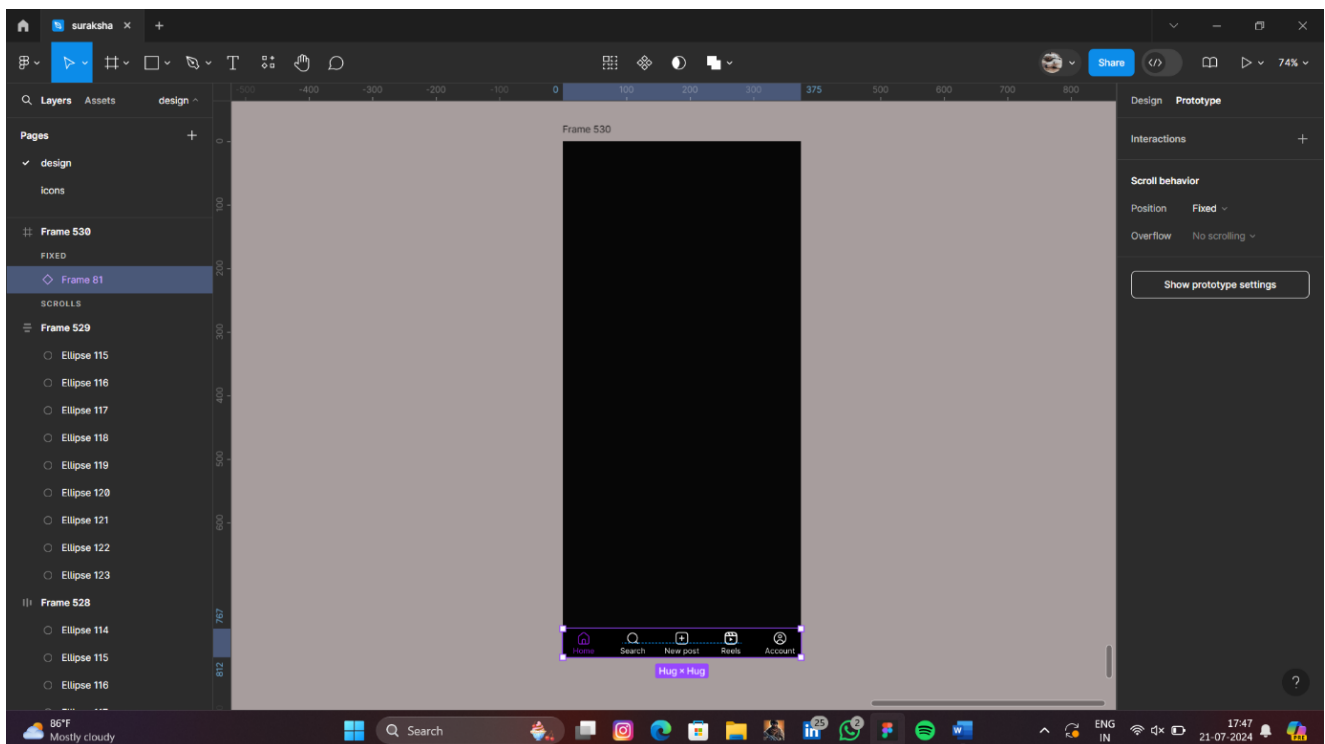

Horizontal

Horizontal scrolling allows users to swipe scroll left and right, while maintaining their vertical position. Use this to create sliders for content, like products, galleries, and libraries.

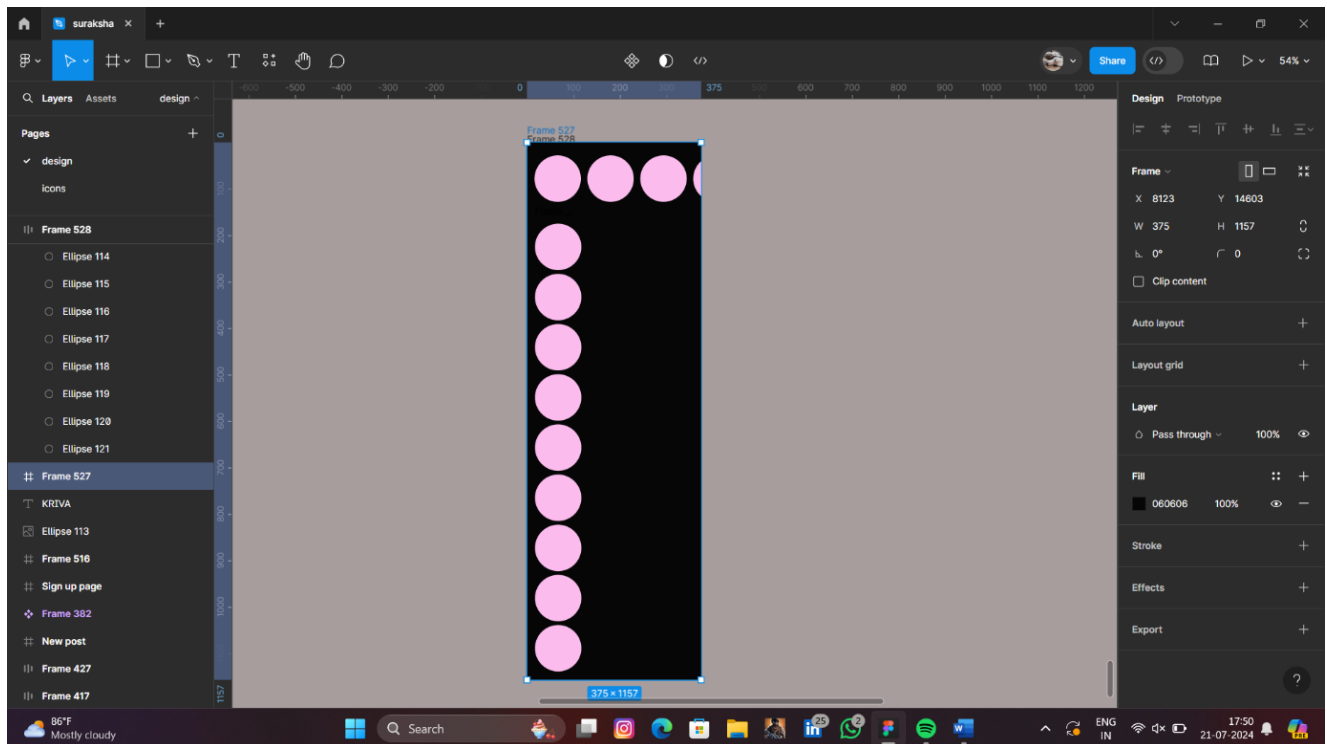

No Scrolling

No Scrolling prevents users from scrolling in any direction. Content that extends beyond the bounds of the frame will not be viewable.

Both Directions

Both directions (horizontal and vertical) let users navigate in any direction, like when viewing a map or enlarged image.

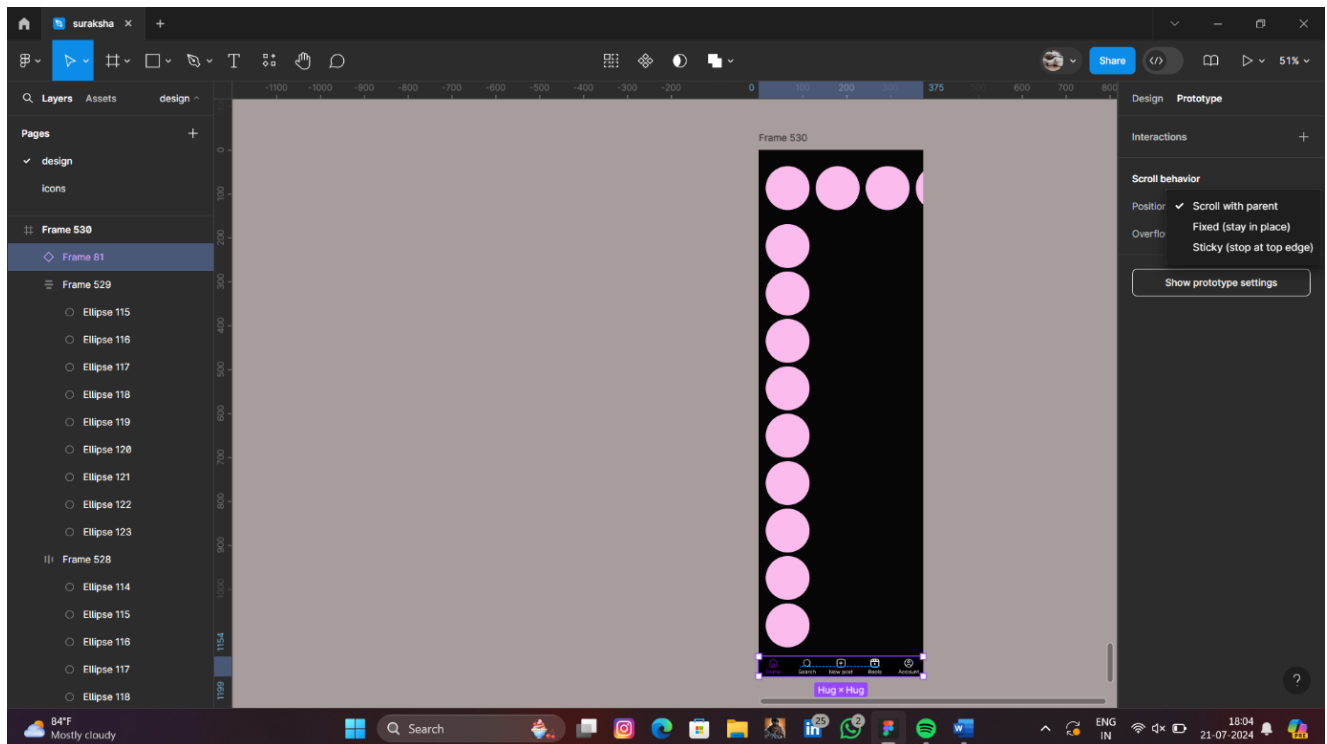

Apply scroll position to objects within a frame

Small position defines how layers in a frame behave when users scroll past them. You can only apply one scroll position to each layer.

1. Select an object, group, or component. The object must be on a frame that has scroll overflow applied.
2. Open the Prototype panel in the right sidebar.
3. In the scroll behaviour section, select the Position dropdown.

Choose from:

- Scroll with parent
- Fixed
- Sticky

Scroll with parent

Objects that scroll with parent move up and down the frame as you scroll. Use this behaviour to mimic the behaviour of scrolling up and down longer pages of content.

Fixed

Fixed objects don't move, even as you scroll up and down. For example, use this option to fix a status bar to the top of the device, or fix a menu to the bottom of a frame.

You cannot assign a fixed scroll position to any objects in a frame with auto layout, unless the object has absolute position applied.

Sticky

Creating a sticky element allow users to remain in the same position on the page while scrolling
